PhD Thesis

Department of Archaeology, University of Sheffield

October 2005
Gazetteer of early medieval, and possible early medieval sites within the study area

Sites are grouped by county, with the counties listed alphabetically, and the sites are arranged alphabetically within each county. Sites are referred to by the name most commonly used, within in a few cases alternatives given. Many sites in the gazetteer have nor been published in full. In these cases, the only published reference takes the form of a short note in a local archaeological journal or in *Medieval Archaeology* and when this happens the name of the periodical and not the author is often given. Finally, in accordance with the wishes of several SMRs, no OS grid references are given in this work.

Aldermaston Court, Aldermaston

SMR No: WB16162
NMR No: SU 56 SE 26
Parish: Aldermaston
Date: Late Saxon?

Unknown

Cemetery?
No. of burials: 1 inhumation
Associated church: Yes
Associated barrow: No

Parts of a skull was discovered during building work at Aldermaston Court site, c.1883-5. The position of the skull suggests the burial was aligned S-N and possibly lay on its side facing east. An iron nail lay adjacent to the skull, possibly from a coffin. Stratigraphic evidence suggests a Saxon or earlier date for the burial. The burial lay just outside the present churchyard Anglo-Saxon suggesting a possible contraction of the churchyard.

Included in burial database: No – not securely dated
Burials included: None

Burghfield

East Berkshire SMR No: 01267.01.00
NMR No: SU67 SE74
Parish: Burghfield
Date: 7th century

Middle Saxon

Cemetery
No. of burials: 50 inhumations
Associated church: No
Associated barrow: Yes

In 1995, 50 graves associated with a ring ditch within a Bronze Age barrow cemetery were excavated at Burghfield. Seventeen of the burials contained grave goods, including knives, spearheads, shears, shield bosses, buckles and fittings for a wooden casket. The grave goods suggest a seventh-century date for the cemetery. Four burials contained wood stains indicative of coffins or planks within the grave. Skeletal preservation was poor and body position could only be determined for one burial, which was supine with one leg flexed and the other extended. It was also difficult to determine the orientation of the body within the grave, but the majority of graves within the cemetery were either aligned west-east or north-south.

Included in burial database: Yes
Burials included: All

Cookham, Cock Marsh

East Berkshire SMR No: 00508.02.00
NMR No: SU 88 NEI5
Parish: Cookham
Date: late 5th to 7th century

Early-middle Saxon

Isolated burial
No. of burials: 1 inhumation
Associated church: No
Associated barrow: Yes

In 1874, four Bronze Age barrows were excavated on Cock Marsh. In one barrow, a secondary inhumation was found accompanied by a knife, a shield boss, a pot, animal bones-
including a dog, and a flint arrowhead and flint flakes. The grave goods suggest an early or middle Saxon date for the burial.

Included in burial database: No – burial may pre-date the seventh century
Burials included: None

In c.1854, six inhumation burials were found during the construction of a railway between Maidenhead and Cookham, approximately half a mile to the north of Cookham. The burials were accompanied by grave goods which included a sword, 2 spearheads, a knife and parts of two shield bosses. The grave goods suggest an early or middle Saxon date for the burials.

Cross Barrows, a barrow group consisting of four barrows, near Ilsley was excavated in 1843. One of the barrows was found to contain a crouched inhumation burial, presumed to be a primary interment. The burial lay with its head aligned to north-east and was accompanied by an iron object thought to be a knife. The grave goods and the location of the inhumation suggest an early medieval date for this burial.

Included in burial database: No – may pre-date the seventh century

Cross Barrows, a barrow group consisting of four barrows, near Ilsley was excavated in 1843. One of the barrows was found to contain six extended, presumably secondary inhumations, just below the top of the barrow. A bronze pin, some sherd of pottery, some ochre beads and horse teeth were found in association with the burials. There is insufficient
information about any of the finds associated with the burials to determine a date for the
inhumations, but given their location an early medieval date is a possibility.

Earley

East Berkshire SMR No: WK3899
NMR No: SU77 SW38
Parish: Earley
Date: late 5th to early 7th century

In 1981, human remains were discovered in a ballast pit during the widening of the Great
Western Railway at Earley. A total of five inhumation burials were discovered, with four of
the burials being supine extended and the other crouched. All the graves were furnished,
with grave goods including brooches, spearheads, knives and buckles. The remaining burials
were cremations, with one urn containing fragments of a burnt comb. The grave goods
suggest an early Saxon date for the cemetery.

Included in burial database: No – burials pre-date the seventh century
Burials included: None

In 1889-90, approximately 30 inhumations and urned cremations were discovered during the construction of the Lambourn Valley railway at East Shefford. Many of the inhumations were accompanied with grave goods including swords, spearheads, brooches, buckles, tweezers, beads and spindle whorls. A further inhumation, accompanied by beads, was found in 1893. In 1912, excavations conducted by Newbury Museum on either side of the railway uncovered a further 26 or 27 burials. The burials were orientated with their heads to the west or south-west. Most of the inhumations were supine often with flexed legs and their heads resting on flints or chalk ledges. Again grave goods were found with the majority of the burials, with many of the finds similar to those found in 1889-90. The grave goods suggest an early Saxon date for the cemetery.

Included in burial database: No – burials pre-date the seventh century

An archaeological evaluation was conducted in 1992 at a c.75ha site at Field Barn Farm, Beenham prior to gravel extraction. A cremation urn was found in a small cut in the top fill of a ditch. The ditch is thought to be of Roman date, although there are some indications of Iron Age activity. No other cremations were recovered during the excavation, although the other trenches were machine stripped down to the level of gravel so it is possible other cremations may have been missed. The urn contained fragments of melted glass, probably from a glass bead, and fragments from 1 or 2 copper alloy pins. The urn was of a 5th century date suggesting an early Saxon date from the cremation.

Included in burial database: No – too early
Burials included: None

Since the early 18th century, there have been sporadic finds of burials and human bone in Kintbury, mainly to the east of the parish church. The earliest recorded find was forty-seven tenth-century Saxon coins under a skull in the churchyard. During the 1860s and 1870s, a number of skeletons were recovered during quarrying work in the area to the east of the church, leading to the area being designated as a "Saxon Burial Ground" on early 20th century OS maps. Another skeleton was uncovered just outside the wall of the current churchyard in a trench during the laying of an electricity cable in 1929. In 1949, a skull was found during the construction of a sewage system. In the same year, a number of skeletons were uncovered by workmen digging a pit. In 1954, a number of human bones were discovered during cutting a trench as part of drainage work at St. Mary’s School, which lay adjacent to the church at that time. All of these finds are thought to be from a single cemetery, which it has been suggested is of late Saxon date. Given the proximity of the finds to the parish church, it is possible that the burials were once part of the late Saxon church prior to its later reduction in size. Alternatively, they may represent a separate burial ground which lay close to the church.

References: - Meaney 1964:47-8

**Pangbourne, Shooter’s Hill**

West Berkshire SMR No: WB3600
NMR No: 
Parish: Pangbourne
Date: 5th to 7th century

In 1836, burials were found during the construction of the Great Western Railway at Shooter’s Hill, near Pangbourne. Finds included skeletons, cremations, spearheads, axes, spurs, horseshoes and Roman coins. The grave goods and the presence of cremations suggest an early Saxon date for the cemetery. The are some suggestions that barrows may have lain in the vicinity of the cemetery.
Included in burial database: No – burial may pre-date the 7th century

**Reading Abbey**

- Late Saxon-Medieval
- East Berkshire SMR No: WB 1378
- NMR No: 
- Parish: Reading
- Date: Late-Saxon-Medieval

In 1906, 40 inhumation burials were discovered during drainage work. None of the burials were accompanied by grave goods in the vicinity of the site of Reading abbey. In 1987, the remains of at ten individuals all aligned with their heads to the west. It is possible that these individuals were part of the same cemetery found in 1906. It has been suggested that the burials from the 1906 excavations may be Saxon, but they may also be part of the medieval cemetery of St. Laurence’s Church which stood near the abbey.

In 1890, the excavation foundations for houses opposite the Jack-of-both-sides Inn, by King's Road in Reading uncovered burials. A total of 51 skeletons were recovered, found at three levels within the ground. Many of the burials on the lowest levels were found with a few iron nails. The second layer of burials were randomly orientated and contained the majority of accompanying artefacts, including a pewter pendant, pewter brooch two glass amulets, and bone draughtsmen. The upper layer included a burial accompanied by a lead plate engraved with three crosses and another with a pewter chalice. Initially the three layers of burial were thought to represent Roman, early Saxon and late Saxon burials. However, more recently it has been suggested that the burials are all post-Conquest.

Reading, Smallmead Road

Roman-early Saxon

East Berkshire SMR No: 02105.00.000
NMR No: SU77 SW197
Parish: Reading
Date: 2nd to 7th century

In 1982, an inhumation in a coffin made from the trunk of an oak carved into a canoe-shaped boat was found by contractors off Smallmead Road in Reading. The coffin was subsequently excavated by Reading Museum and was found to contain a supine extended female skeleton covered by a layer of bark. Radiocarbon dating suggests a Roman or early Saxon date for the burial.

**Remenham, Aston Rise**

Early-middle Saxon

East Berkshire SMR No: 00652.00.00
NMR No: SU78 SE17
Parish: Remenham
Date: late 5th to 7th century

Human bones and associated finds such as brooches and spearheads have been found at Aston Rise in Remenham, but the exact nature of the finds is unclear. One source suggests just a skull accompanied by a spearhead and a brooch were found in the early 20th century, while other sources suggest that it was a skeleton not just a skull. There are also various references to finds of grave goods in both the nineteenth and twentieth centuries at this site. Overall, the evidence suggest that there was an early or middle Saxon cemetery at this site.
Included in burial database: No – burials may pre-date the seventh century
Burials included: None

Slough, Upton Court

East Berkshire SMR No: 00152.00.00
NMR No:
Parish: Slough
Date: Late Saxon – medieval

Isolated burial
No. of burials: 3 inhumations
Associated church: No
Associated barrow: Yes

Three superimposed skeletons were found during the excavations which formed part of the restoration of the manor at Upton Court between 1987-9. It is assumed that the burials pre-date the twelfth-century manor. The present boundary of St. Lawrences churchyard lies less than 15m from the manor and it is thought that the burials may have once been part of the churchyard. The current church contains elements of early twelfth-century date and it is possible that there was an earlier phase. Overall the evidence suggests a late Saxon or Norman date for the burials.

Streatley, Southbury Farm  Middle Saxon

West Berkshire SMR No: 01248.06.00
NMR No: SU58 SE 6,9 & 40
Parish: Streatley
Date: Late 6th to 7th century

An isolated inhumation burial accompanied by a spearhead, knife and buckle was found on Southbury Farm, Streatley in 1932. The grave goods suggest a late 6th or 7th century date for the burial. Several extended inhumation burials, aligned with their heads to the east, were reported found on the farm prior to 1812.

Wolley Downs, Chaddleworth

West Berkshire SMR No: WB3241
NMR No: SU38 SE 6
Parish: Fawley
Date: Saxon?

Unknown

Isolated burial
No. of burials: 2 inhumation
Associated church: No
Associated barrow: Yes

In 1933, the Newbury District Field Club excavated the three Barrows on Wolley Downs. A double grave was uncovered cutting across the ditch of the third barrow. The grave was unfurnished and contained the bodies of an adult male and a juvenile, c.12 years. The male had been decapitated with its skull and mandible lying above the torso of the juvenile burial. Sarsen stones were found at either end of the grave. There is no dating evidence for the burials but a Saxon date was suggested by the excavators.

Included in burial database: No – not securely dated
Burials included: None

Wraysbury

East Berkshire SMR No: 00036.05.000
NMR No: TQ07 SW65
Parish: Wraysbury
Date: late 6th to 7th century

Middle Saxon

Isolated burials
No. of burials: 3 inhumations
Associated church: No
Associated barrow: No

In 1984, a skull was found in a foundation trench at Wraysbury County Combined School. Subsequent excavations identified three inhumation burials. One of burial lay on its right side and the others were supine extended. One of the burials was accompanied by a seax. An early or middle Saxon date has been suggested for the cemetery, but the presence of a seax in one of the graves may point to a late sixth to eighth century date for the burials.

DEVON

Barnstaple Castle

Devon SMR No:
NMR No:
Parish: Barnstaple

Late Saxon

Inhumation cemetery
No. of burials: 105 inhumations
Associated church: Probably
Between 1972-5, rescue excavations on the site of Norman Castle in Barnstaple uncovered 105 unfurnished graves, all orientated approximately west-east. The date of the cemetery is based on stratigraphy with most of the burials are sealed beneath the bailey bank of the Norman castle. Evidence for the use of coffins, in the form of nails and coffin stains, and the use of pillowstones were observed in some graves. Small numbers of river worn pebbles and quartz were seen above and around a number of the burials. There is no archaeological evidence for a church associated with the cemetery, but the site was not completely excavated and one is postulated to have been present. Other skeletons from this cemetery were also found in the vicinity of the 1970s excavations in 1882 and 1927.

Rescue excavations were conducted in 1971 following the demolition of the parish Church of St. Mary Major and the development of the site as a sunken car-park. The discovery of the Roman and early medieval buildings and burials led to a further four seasons of excavations. Six unfurnished burials cut into the remains of the Roman forum and basilica were uncovered during these excavations. Two of the burials were radiocarbon dated to the 5th century and were probably part of a much larger cemetery, largely destroyed by later grave digging. Four of the graves were arranged in a row suggesting they were part of an orderly cemetery. The burials were all orientated north-west to south-east, the same alignment as the demolished Roman buildings, and it is possible that grave orientation was determined by extant features or structures beyond the excavated area.

Included in burial database: No – pre-seventh century.

Rescue excavations were conducted in 1971 following the demolition of the parish Church of St. Mary Major and the development of the site as a sunken car-park. The discovery of the Roman and early medieval buildings and burials led to a further four seasons of excavations. Burials dating from the early medieval through to the early modern period were uncovered during these excavations. 107 of these pre-date the construction of the Norman cathedral in the twelfth century. The burials were orientated approximately west-east. A number of graves contained evidence for the use of coffins or wooden lining in the form of nails or coffin fittings. Layers of charcoal of varying depths were found in the bottom of a number of graves. The gold ring found by the upper arm of one of the burials was the only grave good found in the cemetery.

Kenn

Devon SMR No: SX98 NW183
NMR No: 
Parish: Kenn
Date: Fifth- to eighth-century

Inhumation cemetery
No. of burials: 111 inhumations
Associated church: No
Associated barrow: No

A watching brief along a British Gas pipeline identified the outline of rock-cut graves near Kenn. This led to the excavation of the pipeline corridor during which 111 west-east graves identified. Only 47 graves were completely excavated, all of which were directly threatened by the pipe-laying. There was no evidence for the use of grave goods and the levels of bone preservation were exceptionally poor. Evidence for the use of timber coffins/lining was found in a number of graves. Five rectangular ditched enclosures were recorded, four containing a single grave while the fifth enclosed three graves. Radio-carbon dates suggest the cemetery was in use between the fifth and eighth centuries. The presence of an assemblage of 4th century pottery suggests the presence of a late Roman settlement close to the cemetery - possibly of high status such as a villa or a religious site rather than a farming settlement. A probable Roman ditch runs through the cemetery.

Lundy Island

SMR No:  
NMR No:  
Parish: Lundy Island  
Date: Unknown –possible 5th-7th century

The proposed sale of Lundy Island in the 1960s led to a series of rescue excavations and archaeological evaluations of a number of sites including the enclosed Beacon Hill burial ground in 1968 and 1969. The cemetery’s standing chapel is of twelfth-thirteenth century date, but the burial ground also contained four early medieval inscribed stones dated to between the fifth and seventh century. It was postulated that the cemetery might contain graves of a similar early date. Excavation revealed a number of cist graves of granite slabs. The distribution of these graves suggested that prior to the early medieval period there was another foci to the cemetery nearer the centre of the enclosure and away from the medieval chapel. The earlier foci consisted for a small rectangular enclosure formed of upright granite slabs and boulders containing three graves, with two graves later inserted into the enclosure. The presence of granite stones may indicate the existence of a cairn of piled stones over the three graves. While it is possible that these graves are of early medieval date and contemporary with the inscribed stones, there is no independent evidence for the date of the graves.

Several west-east graves were uncovered during laying a floor in a barn at Wake Court, Bishops Caundle. There was no dating evidence associated with the burials. A pre-conquest date or a civil war date has been suggested.
Bournemouth

Dorset SMR No: SZ 19 SW 36
NMR No: SZ 19 SW 41
Parish: Bournemouth
Date: Early Medieval

A plain featureless Saxon urn was found at Iford Bridge Bournemouth, probably in 1933 although according to some records it was found in 1938. No addition information was available.

Bradford Peverell

Dorset SMR No: SY69 SE21
Parish: Bradford Peverell
Date: Late 7th - early 8th century

In 1977, eight inhumation burials were found during the construction of a patio at Frome View in Bradford Peverell. Excavations in 1978-9, uncovered a further four inhumations. Sporadic excavation during the 1980s uncovered additional burials with a total of 18 skeletons being excavated from the garden in total. Eleven graves contained grave goods ranging from knives and buckles to pendants, bone combs and spearheads. The grave goods suggest a late seventh- to early eighth-century date for the cemetery. Slots possibly indicating the presence of above ground markers were found in two graves.

Brownsea Island

Dorset SMR No: SZ08 NWSO
Parish: Studland
Date: 11th -14th century

Human remains were discovered during building work at Farm Cottage on Brownsea Island in 1974. Subsequent excavations that year and in 1979 uncovered evidence for seven graves (five of which were fully excavated). The unfurnished burials were supine extended and one of the burials was radiocarbon dated to the eleventh to fourteenth century.

During the excavation of a possible Iron Age cross ridge dyke in 1956, the remains of a skeleton were uncovered lying in the silted ditch. Some fragments of twelfth-century pottery were also found in the ditch, but whether they are contemporary with the burial or deposited when the bank collapses at a later date is unclear. Three barrow lay in the vicinity of the cross ridge dyke.

A round barrow on Launceston Down was excavated between 1959 and 1960. Three secondary extended inhumations cut into the top of the mound were found during the course of the excavations. Disarticulated bone from additional burials was found within the graves. One of the graves was lined with flint packing, while another grave contained an iron knife, the remains of a knife sheath, an iron awl, and a bronze buckle and small iron buckle plate. The grave goods suggest a seventh-century date for this burial and by association the other two burials.

In 1938, three skeletons were found during the excavation of a barrow, designated Long Crichel 19 by Grinsell and Tarrant Launceston 44 by the RCHM. One skeleton was prone and the others lay on their sides. No dating evidence was associated with the burials. The
RCHM suggests that the barrow is Bronze Age and the burials may represent Saxon secondary burial. Others have suggested that the barrow was Anglo-Saxon in date and the three burials were primary interments.

**Long Plantation, Barrow 2**

Dorset SMR No: SY69 SW10
NMR No: SY69 SW33
Parish: Frampton
Date: Iron Age to Saxon?

Associated church: No
Associated barrow: Yes

In 1938, secondary inhumation was discovered during the excavation of a bowl burial in Long Plantation. The inhumation lay close to the top of the mound and a late Iron Age to early medieval date has been suggested.
Two secondary burials were discovered during the excavation of the long barrow inside Maiden Castle. One skeleton lay just below the surface at the east end of the long barrow. The burial was supine and lay with its head to the west. The burial was accompanied by a seax and a knife. The grave goods suggest a seventh- or eighth-century date for the burial. The second burial lay not far from the first, but lacked any grave goods and the skeleton had been mutilated and dismembered. Radiocarbon dating suggests a seventh- to ninth-century date for this burial.

A large henge enclosure, probably a Neolithic “henge” monument, was excavated at Mount Pleasant in 1970-1. Two extended inhumations, one found by the enclosures western entrance and the other cut into the fill of a ditch, were uncovered during the excavations. One of the burials was accompanied by an iron knife. The knife suggests an early medieval
date for that burial and the proximity of the second burial may indicate an early medieval
date for this burial.

Included in burial database: No – burials cannot be securely dated to between c.600-1100AD

**Pentridge, Woodyates Inn I**

- Dorset SMR No: SU 01 NW 23 A & B
- NMR No: SU 01 NW 39
- Parish: Pentridge
- Date: 7th century

The excavation of a long barrow on the west side of Bokerley Dyke near the Woodyates Inn,
prior to 1810 led to the discovery of an extended female skeleton. The burial was
accompanied by beads, one of which was on a gold wire, a gold pendant, an ivory ring from
a bag or pouch, three iron clench bolts, a hook and a buckle. The grave goods suggest a
seventh-century date for the burial. It has been suggested that the clench bolts may be from a coffin or bed burial. The burial was initially thought to be a primary inhumation, but subsequent work has identified the burial as coming from a long barrow.

In 1863, human remains were found in the vegetable garden of a house called Charlton Barrow. The house is thought to have been named after a barrow which once stood on the site. There is no evidence for the date of the burial, but if an early medieval burial lay in the vicinity it is possible that the burial may have been a secondary inhumation in a barrow, and thus possibly of early medieval date.

Parish: Swanage
Date: Unknown

Cemetery
No. of burials: c. 10 to 12 inhumations
Associated church: No
Associated barrow: No

Prior to 1954, a number of skeletons, estimated to be between 10 and 12 individuals, were found during the construction of a garage at the rectory in King’s Road, Swanage. The skeletons were arranged in “a clock formation with heads to the centre and a stone over each head.” No dating evidence was found in association with the burials, but this type of arrangement has been observed in number of late Saxon execution cemeteries and as such it is possible that these burials are of early medieval date.

Cemetery
No. of burials: 50 inhumations
Associated church: No
Associated barrow: No

50 graves were uncovered during excavations prior to the construction of the Tolpuddle and Puddletown Bypass in 1998. The burials were supine and with the exception of an infant burial, extended. The graves were orientated approximately west-east and appeared to have been arranged in rows. A few graves contained evidence for the use of coffins and /or stone linings. No grave goods were recovered from any of the graves, although a glass bead was recovered from the fill of the one the graves and is thought to be an accidental inclusion. Five burials were radiocarbon dated (see table below) and the cemetery was dated to c.400-700AD.

Parish: Dorchester  
Date: 7th century

In 1892, a skeleton was found during work in the garden of Wareham House, Dorchester. Subsequent investigations uncovered a further four skeletons. All burials were aligned SW-NE. Three of skeletons were supine extended while the other two lay on their sides. Four of the graves were unfurnished with the fifth containing a knife and an iron nail. A further three skeletons were discovered late the same year during garden activities. Two of these burials were accompanied, one with silver wire hoops and glass beads and the other by a bone comb. The grave goods suggest a seventh-century date for the cemetery.

Parish: Swanage  
Date: 7th century

In 1949, three unfurnished cist graves were discovered during building work at Shepherd’s Farm. In 1982, more graves were discovered during quarrying prior to the extension of buildings at the farm. Subsequent excavations uncovered 55 graves. Many of the graves were stone lined. This ranged from partially stone lined graves to cist burials lined with split limestone slabs and occasionally with surviving stone lids. One burial was accompanied by a small iron knife. Four burials were radiocarbon dated and when this was combined with other evidence from the site a seventh-century date for the cemetery was suggested.

Bevis Grave, Bedhampton

Hampshire SMR No: SU60 NE12A
NMR No: 
Parish: Bedhampton
Date: 7th to 10th century

Cemetery
No. of burials: 88 inhumations
Associated church: No
Associated barrow: Yes

Rescue excavations were undertaken in 1974, 1975 and 1976 at Bevis' Grave when the site of the long barrow was found to lie along the proposed route of the A3(M). A total of 71 graves containing the remains of 88 individuals were recovered from within and adjacent to the south ditch of the long barrow. Two of the graves were orientated south-north. The remaining graves were orientated approximately west-east. Where body could be determined the majority of burials were supine extended, although six individuals were buried on their sides. The majority of graves were unfurnished but 20 individuals were interred with grave goods, predominately knives and/or buckles. Although this cemetery had many of the characteristics of cemeteries of the seventh and eighth centuries, one of the graves contained a strap-end, which was dated stylistically to the ninth century. Five burials from this cemetery were radiocarbon dated as part of this study (see below). The radiocarbon data indicates that the cemetery originated in the seventh century and that it continued in use into the ninth and tenth centuries.

Breamore, Shallow Farm

Hampshire SMR No:
NMR No: 
Parish: Breamore
Date: 6th century

Cemetery
No. of burials: 1 inhumation
Associated church: No
Associated barrow: Yes
Metal detector finds, including a sixth century bronze Byzantine bucket, a spearhead and an iron shield boss, led to the excavation of seven test pits in a low mound at Shallow Farm, Breamore in 2001. This led to the discovery of four burials in two of the test pit grouped towards the middle of the mound. Two of the burials were supine extended with their heads to the south, while the orientation and body position of the other burials is unclear. Grave goods found with the burials included shield bosses, knives and a spearhead. The grave goods suggest a sixth-century date of the cemetery. Although it is possible that the mound in which they were interred is prehistoric, its construction is unusual and it may possibly be of early medieval date.

Included in burial database: No – burials predate the seventh century

In 1900, human remains were discovered during the construction of the Meon Valley Railway at Droxford. Many of the burials were accompanied by grave goods and between 1900 and 1902, artefacts recovered from the site included 30-40 spearheads, several shield bosses, glass and amber beads, a saucer brooch, a button brooch, a small square-headed brooch and a Roman cross-bow brooch. The grave goods suggested the presence of a large early Anglo-Saxon cemetery. The site of the cemetery was rediscovered in 1973 when erosion on land adjacent to the railway revealed the outline of two graves and a iron spearhead, later found to come from a third grave. Due to the threat posed by erosion, excavations were undertaken on the land under threat in 1974. A total of 43 probable grave cuts were identified and 41 of these were fully excavated. Thirty-seven graves were orientated east-west and four were aligned north-south, with many of the burials being accompanied by grave goods, all of which suggest a late fifth- or sixth-century date for the inhumations.

Date: 5th century

**Cemetery**
No. of burials:
Associated church:
Associated barrow:

In 1984, an iron sword was found when a trench was dug for a gas pipeline through the playing fields of Itchen Abbas primary school. Although the outlines of 20 graves were visible in the trench only the grave badly disturbed by the trench was fully excavated. It contained the disturbed remains of an extended male skeleton and contained a spearhead, a knife and a bronze chape and two bronze belt fittings. The sword original found by the contractors also came from this grave. The grave goods suggest a mid to late fifth-century
date for the burial. The remaining nineteen graves were recorded in section. Two further
graves were excavated the following year as part of a project at the primary school. In one
burial the skeleton of a young male was accompanied by the remains of a purse and a bronze
coin and had hob-nails around his feet, presumably from shoes or boots. The other burial
contained no grave goods. In 1991, an archaeological assessment of the site to establish the
extent of the cemetery was conducted prior to the proposed development of the site.
Approximately 60 graves were revealed in plan during this work, but were not excavated.
There are also vestigial traces of cremations and evidence for a ditch surrounding one of the
burials. Overall, the evidence suggests the presence of a large cemetery dating to the late
Roman and early post-Roman periods, most probably between 400-500AD.

Excavation in 1932 of an enclosure detected using aerial photography on Meon Hill resulted in the discovery of a group of 10 skeletons. All burials were aligned with their heads to the south. Six burials had been decapitated and four had bound hands, two behind their backs and two to the front. Items found with the burials included buckles, a coin of the reign of Edward the confessor, a bronze wrist-fastener and a bronze chape and suggest a later Saxon date for the cemetery.

Parish: Portchester East
Date: 11th century

Middle Saxon
Cemetery
No. of burials: 22 inhumation
Associated church: Possible
Associated barrow: No

A small cemetery containing 22 individuals was uncovered during Culiffe’s excavation of Portchester Castle in the 1960s and dated to the eleventh-century on stratigraphic grounds. All the supine extended burials were unfurnished and orientated west-east. Nails were found with a number of burials, possibly indicating the presence of coffins. The burials lay to the north of masonry tower within the walls of the Roman fort. The tower was rebuilt soon after the cemetery was established in the eleventh century and is thought that it may have had a religious function.

Cemetery
No. of burials: At least 10 inhumations
Associated church: No
Associated barrow: Yes

During chalk digging near the Naval telegraph on Portsdown Hill in 1816, a Neolithic long barrow was opened and the remains of at least 10 individuals were recovered. The inhumations appear to have been in distinct graves with some graves containing more than one individual. One of the skulls contained the top of an iron pike and it has been suggested these burials may have been part of a war cemetery. No other artefacts or dating evidence was found with the burials, but given their location within a barrow an early medieval date is a possibility.

**Portsdown II**

- SMR No: SU60 NW13A
- NMR No:
- Parish: Cosham
- Date: Late 7th-8th century

Cemetery
- No. of burials: 25 bodies, 17 graves
- Associated church: No
- Associated barrow: Possible

In 1948, four burials were discovered when a road was widened on Ports Down. This led to rescue excavations which uncovered a further two graves. In 1956, a further eleven graves were excavated prior to further road works. In total, 17 graves containing 25 inhumations were recovered. Three of the graves contained grave goods, which date the cemetery to the late seventh or early eighth century. All of the graves were orientated west-east and stones were found in the sides of a number of graves. A Bronze Age cremation and secondary burials were also uncovered during the excavation. It is possible that the Bronze Age cremation may have been beneath a barrow, although no trace now survives, and this may have formed a focus for the later early medieval cemetery.

- Date: Middle Saxon

Cemetery
- No. of burials: 2 inhumations
- Associated church: No
- Associated barrow: No

Two inhumations were discovered during excavations prior to road works to the east of the George Inn on Portsdown Hill in 1966. Both inhumations were extended with their heads to the west. One of the burials contained grave goods including three iron knives, a buckle and a bronze bound bucket. The burial was surrounded by wooden fragments and nails, presumably from a coffin, and part of the base of the grave had been lined with flint nodules. The grave goods suggest a middle Saxon date for this burial. The second grave contained no grave goods and the occupant had been decapitated with head placed on the upper torso above the shoulders. This burial lay some 70 ft from the first burial and as such may not have been associated with it. As such, only the burial containing the grave goods was included in the burial dataset. It has been suggested that these burials may be outliers of the cemetery found on Portsdown Hill in 1816 (Portsdown I), but in view of the difficulties in accurately locating that cemetery, they are being treated as two separate sites in this study.

<td>Excavations were conducted at Portway, Andover prior to the construction of the Portway industrial estate in 1971-3. The initial aim was investigate enclosures and linear ditches visible in aerial photographs. However, once burials were discovered excavations were undertaken to examine the cemetery before it was destroyed. A total of 69 inhumations and 87 cremations were excavated. The majority of inhumation burials were orientated with their head to the south. Five graves contained flint nodules placed around the edge of the base of the grave. Evidence for wooden structures was found in seven graves, possibly representing coffins or a lining of wooden planks. The majority of inhumations were supine extended, although there were four burials placed on their sides with flexed lags and three crouched burials. Many of the inhumations contained grave goods including brooches, perforated Roman coins, chatelaines, knives, buckles, beads, spearheads and shield bosses. The three quarters of cremations were contained in urns, with the remains quarter un-urned. Grave goods in the form of buckles, fragments of bronze and melted glass beads were found with some of the cremations. The grave goods and presence of cremations suggest an early Saxon date for the cemetery.</td>

By 1893, the long barrow in Long Barrow Field had virtually been levelled to the ground and had in the past been the site of the discovery of human remains and weapons. Most of these finds had long vanished but a spearhead found not long before 1893 was recorded and is of early medieval date. In 1939, a seax was found close to the edge of the barrow. Overall, the evidence suggests that the barrow once contained secondary inhumation of early to middle Saxon date.

Romsey Abbey  Middle-Late Saxon

Hampshire SMR No: SU32 SE65C  Cemetery
NMR No: SU32 SE5  No. of burials: 31 inhumations
Parish: Romsey  Associated church: Yes
Date: Middle-late Saxon  Associated barrow: No

In 1839, a lead coffin was discovered while digging a grave within Romsey Abbey. No skeleton was found in the coffin only a scalp of long hair resting on a wooden pillow. A late Saxon has been suggested for the burial.

A series of small scale excavations were carried out at Romsey Abbey between 1973 and 1991. A total of 31 burials of early medieval date were discovered during these excavations. All burials were all aligned with their heads to the west. No grave goods were found with any of the burials and there was no evidence for the use of coffins. Four of the burials lay on charcoal beds and one of the graves was partially lined with stone. Radiocarbon dating of the charcoal from two of the charcoal burials suggests a middle to late Saxon date for the burials.

In the summer of 2004, a further 14 burials of suspected early medieval date were excavated during a programme of road enhancement around the abbey. These burials, which include a charcoal burial, are currently undergoing post-excavation analysis and were not included in the burials dataset.

In 1982, an inhumation burial thought to be medieval date was found at Abbey Roadway. No further information is available and as there is no Abbey Roadway in Romsey the location is unclear. It is possible given the name of the road in which the skeleton was found that the burial lay near the Abbey. If so, the burial may be part of the Abbey churchyard and this would suggest a late Saxon or medieval date for the burial.

In 1972, an inhumation burial was discovered when laying a sewage pipe near Shavard’s Farm, Meonstoke. Half of the grave had been removed by the pipe, but the remaining lower part of the grave contained and extended west-east inhumation and a shield boss, a knife, a buckle and a number of flints. A spearhead had been displaced by the pipe. The grave goods suggested a sixth-century date for the burial. In 1983, a further two burials were uncovered approximately 50m to the north. These burials were recorded and backfilled. These led to excavations between 1984 and 1988. A further five burials were excavated during these excavations, including one of the burials first found in 1983. In addition a further two graves were located but due constraint of time were not recorded or excavated. Among those burials was a grave containing weapons, which has been dated to the seventh century. Further excavations in 1998 and 1999, a further nine graves were excavated, including a double burial. Only two of the nine graves were furnished, one with a knife and the other with a knife and buckle. One grave contained nails in the fill, possibly evidence for a coffin. The majority of the skeletons were supine extended, but one burial was prone and another crouched. The majority of burials were either aligned north-south or west-east. The grave goods suggest that this cemetery was in use during the sixth and seventh century.

Included in burial database: No – some of the burials may predate the seventh century.

<td>The site was discovered in 1947 during work to improve the road at the Snell's Corner crossroads, which lie c.1.5 miles to north of Horndean. The resulting excavation by the Ministry of Works uncovered 33 Anglo-Saxon inhumation as well as Bronze Age, Iron Age and Roman burials. The majority of the early medieval burials were orientated south-south-west to north-north-east with the heads to the south. The one exception was orientated with the head to the north. Where body position was known eighteen burials were supine, with either extended or flexed legs while another four burial lay on their sides. Twenty-seven graves contained grave goods, with thirteen of these burials just containing a knife and/or buckle. A seventh century date is suggested for the Anglo-Saxon burials based on the grave goods. The cemetery lies to the south-south-west of a prehistoric barrow.</td>

<td>Between 1936 and 1941, excavations were carried out at Bitterne Manor House, which lies on the site of the Roman settlement of Clausentum. Human remains were uncovered in a number of trenches, with at least 16 burials being identified. The burials were aligned with their heads to the west and two were accompanied by iron knives, while a third grave may have contained a bronze pin. In 1951 and 1953 two further unaccompanied skeletons was found in the Manor grounds. One lay with its head to the east and the other with its head to the west. The presence of iron knives makes an early medieval date a possibility for this cemetery.</td>

Three separate archaeological excavations in 1986, 1994 & 1997-8 in the area around Cook Street uncovered parts of an early medieval cemetery. The Cook Street cemetery (SOU 254, 567 & 823) consists of 21 burials and disarticulated human remains recovered from a number of other features. Eighteen of the burials lie to the east of a ditch, which appears to demarcate the western limits of middle Saxon activity on the site, and is thought to mark the boundary of either the cemetery or the settlement of Hamwic. All of these burials lay approximately west-east with the exception of a single east-west burial. Seventeen of the burials were unfurnished while the eighteenth contained a knife and linked pins of silver and bronze. Three of the eighteen burials are encircled by penannular ditches. No grave was found in the fourth penannular ditch from the site, although there is a possibility that the deceased was interred in a central mound created from soil displaced by the excavation of the penannular ditch. Four of the graves contained wood stains indicating the presence of coffins or wooden lining. The stakeholes observed in one grave may have been used to hold supports for a wooden lining, while another grave contained a possible cross support at its east end. The presence of penannular ditches and cross-supports suggests a seventh- or eighth-century date for the cemetery as does a radiocarbon date of 642-777AD, at a 2σ level of confidence, from a burial within one of the penannular ditches, although a late seventh-century origin cannot be excluded. A further three burials from the site lie in the ditch to the west of the cemetery. Two of these burials are aligned north-south like the ditch with their head to the south and lay in the lowest fill of the ditch, while the disturbed remains of a third individual also recovered from the ditch and may represent a shallow west-east burial cut into the top fill of the ditch. The relationship between the burials in the ditch and the rest of the cemetery is not clear. The ditch itself is thought to be of similar date as the cemetery, but it is unclear how long it remained open. The two south-north burials found in the lowest layer of ditch fill have been radiocarbon dated to 978-1206AD and 675-886AD at a 2σ level of confidence. The radiocarbon dates raise the possibility that at least one of the ditch burials may be contemporary with the rest of the cemetery. However, given that the ditch may have served as a boundary either the cemetery or the settlement, it is equally possible that the ditch remained open until after the rest of the cemetery, or even the settlement itself, went out of use and one or more of the ditch burials may represent isolated later interments.

The remains of three individuals, including the fragmentary remains of 2 males, one a younger adult and the other a mature adult, from Pit 60 and the fragmentary remains of older male from pit 233, were found during excavations of site SOU 161 on the Lower High Street in 1966. One of the burials was cut by a twelfth/thirteenth century house. Radiocarbon dating suggests an 8th to 11th century for the burials and suggests a cemetery lay in the vicinity of the site.

In the late 18th century, human remains uncovered during the construction of a cellar at the rear of the property of Daniel Payne at 98 High Street. Excavations at SOU 266, an area adjacent to SOU 161 (Lower High Street I), uncovered a 18th cellar, probably that of Daniel Payne, and also recovered isolated fragments of human bone from 4 contexts. Radio-carbon dating of a human tooth suggested a date between the late fifth to seventh century AD. In addition, in 1957 a skeleton with grave goods (glass beads) recovered from site of Poupart's Warehouse (SOU 334), which lies in the vicinity of SOU 266. This suggests the presence of one or more burials in the vicinity of the Lower High Street site and may indicate occupation of the area prior to the foundation of the late Saxon town.

Inhumation burials were discovered in Bittern Southampton during the construction of the Northam Bridge in 1954-5. The remains of at least twenty individuals were recovered. The only artefacts found with the burials were a few nails and some coins. In 1804, fifty burials were found in the vicinity of the 1950s finds. The burials are undated but an early medieval date is a possibility given the proximity of this site to the seventh-century burials at SOU 414 and SOU 207.

Associated barrow: No

Between 1977 and 1989, excavations were carried out prior to the Six Dials road improvement scheme across a large area of the northern part of the middle Saxon settlement of Hamwic. During the course of these excavations a cemetery was uncovered. It consisted of a total of eleven articulated burials and three groups of disarticulated bone, representing in total at least 19 individuals. No evidence for the use of grave goods, above-ground markers or any form of grave furniture was observed, although iron nails were recovered from the area around the graves. The graves were all orientated approximately west-east and where it could be observed all the burials were supine extended with the exception of one burial where the legs were flexed. The spatial organisation of the cemetery also seems to have been affected by the large quantities of slag and charcoal found unevenly spread across the site from earlier iron working prior to the advent of the cemetery, with the distribution of the burials within the cemetery corresponding closely to that of the slag and charcoal. The layers of slag and charcoal are thought to have been deposited between 750 and 850 AD on the basis of the pottery they contained. This appears to indicate a date later than the mid-ninth century date for the cemetery. In addition, the subsidence of a number of burials into middle Saxon pits, thought to have been in use between 750 and 850 AD, suggest that little time had elapsed between the filling of the pits and the deposition of the burials. Overall, all the available stratigraphic evidence suggests a possible late ninth century date for the burials. However, radiocarbon dating of one of the graves as part of this study produced a date of 550-690 AD at a 2σ level of confidence. This date is difficult to reconcile with the date suggested by the stratigraphic evidence, particularly as the sample comes from a burial (6004) cut into the top of a pit containing pottery dated to 750 to 850 AD. A second sample
has been submitted for radiocarbon analysis and until receipt of this result, it seems prudent to continue to use the stratigraphic evidence and date the cemetery to the ninth century.

The evidence for a possible cemetery at SOU 7/14 is admittedly fragmentary. It consists of the lower part of a single west-east grave from SOU 7 and the disarticulated remains of at least two individuals recovered from middle Saxon pits and other structural features at SOU 14. An east-west aligned sub-rectangular feature from SOU 14 may represent a grave, although no human remains were present and at 1.4 metres in length if a grave it must have contained a juvenile. While it is possible that the human remains from these sites represent the remains of two separate small cemeteries or even just isolated burials, it has been suggested that a cemetery stretched the 47 metres between the two sites. On site SOU 14, the burials to appear predate the early middle Saxon wells and pits, which suggests an early date for the burials.

In 1973, a cemetery was uncovered during excavations near Marine Parade within the site of the middle Saxon wic, Hamwic. A total of 81 burials were uncovered lying either side of a timber structure, thought to be a church. When it could be determined the burials were supine extended and orientated west-east. The majority of the burials were unfurnished, with just two burials accompanied by knives. Wood stains, from either a coffin or a wooden lining, was found in one grave. Four burials from the site were radiocarbon dated as part of this study and when considered with the stratigraphic evidence, this suggest a eighth to ninth century date for the main period of use of the cemetery. However, one of the burials
radiocarbon dated burials gave a seventh century date, raising the possibility that a church may have been established on a pre-existing graveyard.

Excavations prior to redevelopment in Clifford Street in 1968 uncovered a small cemetery of 10 graves and 6 grave-like features as well as some disarticulated bone. The graves were
aligned roughly west-east and unfurnished, although a series of sceattas, dating to c.700-715 AD was found in fill of one of the graves. Four of the graves contained evidence for the presence of wooden-linings or coffins, with, in one case, cross-supports lying below a wooden coffin, while structural features such as the rectangular slots cut into the floors and ledges on the side of some graves may have been used to support wooden grave linings. Other structural features included evidence for possible settings for above ground markers in the form of post-holes at the eastern end of one grave and a slot, running virtually the length of the grave, cut into the top of the grave fill of another. The cemetery, also, contained what was probably a penannular ditch encircling one of the graves. A series of post-holes associated with another grave and it has been suggested that the post holes represent a bicameral church or a mortuary chapel but the evidence is far from clear. The sceatta found in the fill of one of the graves suggested an early eighth-century date for the cemetery, while a radiocarbon date obtained from one burial suggested a late seventh-to early eighth-century date for the cemetery.

Skeletons were uncovered during the first half of the nineteenth century during digging for brick earth in a field (SOU 47) to the south of the SOU 32 cemetery. Little is known about the burials themselves, but a glass tumbler was reportedly found lying beside one of the skeletons and it is possible that some of the sceattas recovered may have come from graves. While the precise location of the burials within the SOU 47 is unknown, the field lies only fourteen metres to the south of SOU 32 and the burials are likely to have been part of the SOU 32 cemetery.

Disarticulated remains were also found in pits and in occupation layers during the excavation of SOU 519 on the corner of Clifford St and St. Mary's Street in 1993. Given the proximity of the site to SOU32 and SOU 47, it is possible that this site is part of the same cemetery.

Associated church: No
Date: 8th century?
Associated barrow: No

Three relatively intact burials and a small quantity of redeposited, disarticulated bone from at least another three individuals were recovered from the site of SOU 34 during excavations in 1962. All three graves were orientated west-east and unfurnished. There is no record of wood stains in any graves although one of the graves may have had a slot cut along the length of the grave into the upper fill, similar to that seen at SOU 32. Pottery dating from the mid-middle Saxon period recovered from a pit, which post-dates the burials, implies the cemetery dates to the early part of the middle Saxon period. Redeposited, disarticulated
human remains were recovered during the excavation of SOU 43 in 1961 from areas previously disturbed in the nineteenth century. While much of the bone excavated from SOU 43 has been lost, the surviving bones contain the remains of at least five individuals. SOU 43 is thought to lie to the east of SOU 34 and the human remains from both sites may have originated from the same cemetery. Another part of this cemetery is thought to have been identified during brick-earth digging on a site now known as SOU 48 where a large number of inhumations, including one with a glass vessel over its face, were uncovered in the first part of the nineteenth century.

During the excavations of the Kingsland site in 1946-50 prior to redevelopment, the skeleton of an infant less than six weeks old were found in a rubbish pit. The location of the pit within the middle Saxon settlement of Hamwic and its contents suggest a middle Saxon date for the skeleton. An adult mandible was also recovered during the excavations from an unspecified pit, while in 1986 the disarticulated remains of at least 2 individuals were discovered in a trench some 10m from the site of the original excavation. It has been suggested that a cemetery may lie in the vicinity of SOU36.

The burials were uncovered by a mechanical digger during the laying of new cables in 1984, with the remains of one burial removed by workmen at the corner of Hawkeswood Road and Bitterne Road. At least another eight burials were recovered from the site. There is no report of any objects accompanying the burials nor were there apparently any wood stains, indicating the presence of wooden linings or coffins, although given the recovery conditions, there is a possibility that such evidence could have been overlooked. Radiocarbon dating of one of the burials, as part of this study suggests a late seventh- to eighth-century date for the cemetery. There is a possibility that these burials and those from SOU 414 form part of the same cemetery.

Excavations in 1990 in Hawkeswood road, on a site known to lie between the inner and outer ramparts of the Roman fort of Clausentum, prior to the construction of a car showroom uncovered the remains of at least six individuals. The supine extended burials were orientated west-east. Five of the burials were unfurnished while the sixth was accompanied by a spearhead. The spearhead was initially thought to be of early Saxon date, but has recently been re-examined and identified as a type used predominantly in the seventh century. Radiocarbon dates from one of the skeletons also gave a seventh to eighth century date, suggesting that the cemetery was in use during the seventh and eighth centuries. There is a possibility that these burials and those from SOU 414 form part of the same cemetery.

Southampton, St. Mary’s Stadium I  Middle Saxon

SMR No:  
NMR No:  
Parish: Southampton  
Date: c.650-720 AD  
Cemetery  
No. of burials:26 inhumations, 18 cremations  
Associated church: No  
Associated barrow: No

Excavations between 1998 and 2000 prior to the construction of a new football ground, the St. Mary’s Stadium uncovered two early medieval cemeteries. The largest of these was a mixed rite cemetery, referred to in this study as St. Mary’s Stadium I, consisting of 18 cremations and 24 inhumations, interred in 22 single graves and one double grave. Two additional furnished burials recovered from the adjacent site of SOU 20 in 1975 are also considered to be part of this cemetery, as are the disarticulated redeposited bones found to the south of SOU 20 at SOU1. With the addition of the burials from SOU 20, there are a total of 26 inhumations from 25 graves in this cemetery. Four of these graves, including the double burial, were orientated north-south, while the remaining burials were aligned approximately west-east. Twenty-three of the twenty-six inhumations were furnished, many with elaborate grave goods. Wood stains indicating the presence of wooden linings, planks or coffins were found in four graves. Possible settings for above ground markers were seen in the form of a small slot to the west of one grave, while another had two slot-like features at the west end of the grave. The eighteen cremations were all contained in urns, seventeen of which were deposited in small sub-circular graves while the eighteenth lay in an irregular shaped grave. Five of the cremations contained fragments of animal bone, probably the remains of pyre goods, while grave goods, in the form of an ivory ring and an incised disc, probably of antler, were found with two cremations.

Grave goods suggest a late seventh- to early eighth-century date for the inhumations. Establishing a date for the cremations proved to be difficult given the lack of grave goods. Charcoal from three cremations gave calibrate radiocarbon dates of 670-880 AD, 610-770
AD and 550-680 AD at the 2σ level confidence; while a date of 430-630 AD was obtained from cremated bone using an experimental methodology. The radiocarbon dates from the charcoal were considered more accurate and indicate that the cremations are of seventh, and possibly eighth, century date. This suggests that the cremation burials were contemporary with at least some of the inhumation burials in this cemetery.

**Southampton, St. Mary’s Stadium II Middle Saxon**

SMR No:  
NMR No:  
Parish: Southampton  
Date: 8th century  

Cemetery  
No. of burials: 8 inhumations  
Associated church: No  
Associated barrow: No  

Excavations between 1998 and 2000 prior to the construction of a new football ground, the St. Mary’s Stadium II uncovered two early medieval cemeteries. The second cemetery, called St. Mary’s Stadium II in this study, consisted of eight inhumations were found less than 100 metres to the north of the late seventh- and early eighth-century cemetery of St. Mary’s Stadium I, and may have been a small family burial ground. The unfurnished burials were all supine with extended or slightly flexed legs and orientated with their heads to the west. There was no evidence for the use of grave structures or above ground markers, although the base of one grave was lined with a three centimetre layer of gravel. Although it is possible that these burials could be part of the St. Mary’s Stadium I cemetery, their separation from the earlier cemetery and the differences in funerary provision combined with a radio-carbon date of 650-950AD from one of the graves seems to indicate a later eighth-century date.

**Southampton, Westgate (SOU 25) Late Saxon**
In the 1970s, a site bounded by Westgate and Bugle Streets and lying within the site of the late Saxon town was excavated prior to a housing development. Three W-E burials, two supine extended and one partially flexed, were uncovered along the northern edge of the excavated area. One of the burials was interred with a knife and a fragment of animal bone while another grave contained a fragment of animal bone. The burials lay in a single west-east line and it has been suggested that they may have been southern edge of a cemetery. The suggestion that the burials may date to the late eleventh century led to their being radiocarbon dated as part of this study with the results suggesting a tenth-century date for the burials.

Southampton, Upper Bugle Street III Middle-Late Saxon (SOU 124)

In 1976, during the third phase of excavations at Upper Bugle Street in Southampton an inhumation burial was discovered within a west-east aligned ditch. The skeleton was aligned west-east and although the burial was supine and extended, the limbs were in a degree of disarray suggest that this may not have been a formal interment. The ditch was thought to be the earliest feature on the site thought to have been infilled during the tenth and eleventh centuries. Charcoal from the ditch was radiocarbon dated giving a middle Saxon date, although there were concerns that the sample had been contaminated. The burial was radiocarbon dated as part of this study and gave a eighth- to tenth-century date.

South Tidworth I, Warren Hill

Part of a skeleton was uncovered during work on an army track in 1983. When this adult skeleton was raised, a second skeleton was identified in the south-east corner of the grave. The second skeleton was an infant and its hands and feet appeared to have been bound. When the human remains were analysed, the fragmentary remains of a third individual, a juvenile of 13-14 years were identified. This multiple burial with the bound infant and the adult buried face down suggest an atypical means of disposing of the dead. No dating evidence was recovered.

Included in burial database: No – not securely dated
Burials included: None

References:- Allen & Anderson 1990; Allen 1983.

South Tidworth II, Warren Hill

In 1992, soldiers digging a trench on Warren Hill, near South Tidworth, uncovered human remains. Site was excavated and a grave containing the remains of four adult males, orientated south-north, lying side by side was uncovered. Three of the burials lay on their backs, while the fourth lay slightly flexed on its right side. The four individuals appear to have been interred at the same time. The grave was furnished and contained four spearheads, three shield bosses, one knife, one decorated belt and an antler comb. The grave goods suggest a sixth-century date for the burial. This burial lies some 500m from a triple burial (Warren Hill, South Tidworth I) and it seems unlikely that the two burials are linked.

Included in burial database: No – burials pre-date seventh century

In 1935 and 1936, an area on the north-east of the hill on Stockbridge Down close to a barrow was excavated and a cemetery of 41 individuals, along with additional disarticulated bone, was discovered. The bodies had been interred in shallow graves often with little care and the graves were orientated in various directions, although the majority lay with their heads to the west or south-west. Two individuals had been decapitated and their heads placed between their legs, while the position of the arms of at least 16 individuals suggests they had been interred with their hands bound. Artefacts found in association with the burials included buckles, iron rings, a wrist fastener and six coins dating to the last years of the reign of Edward the Confessor, and suggest a late Saxon-Norman date for the burials.

Wherwell Abbey

Hampshire SMR No: SU34 SE7 B & E  
NMR No: SU34 SE19  
Parish: Wherwell  
Date: c.986-1539AD

Late Saxon-Medieval

Cemetery  
No. of burials: At least 15 inhumations  
Associated church: Yes  
Associated barrow: No

Graves were discovered on the site of Wherwell abbey during landscaping at The Priory early in the 20th century. In c.1935 large quantities of bone were discovered on the area though to be the burial ground of the lost abbey. Work by the owner of The Priory in the garden in 1996 uncovered the remains of at least six individuals. In 1997, an archaeological evaluation of the site uncovered the remains of at least nine individuals. The burials were supine extended and aligned west-east. The density of burials indicates the area was used as a cemetery and given their location, the burials are presumably associated with Wherwell Abbey. The abbey was founded in c.986 and dissolved in 1539, which suggests a late Saxon or medieval date for the burials.

**Winchester, The Brooks**

**Late Saxon**

- Winchester SMR No: 1465
- NMR No: 
- Parish: Winchester
- Date: Late 9th to 11th century

The remains of two individuals were uncovered during the excavation of The Brooks in Winchester in 1987-8 prior to redevelopment of the site. The west-east burials lay in shallow graves with no evidence for the use of coffins or grave goods. One of the burials had slumped into an earlier timber-lined pit, which has been dendrochronologically dated to c.880AD, while timber houses were built over the burials in the tenth and eleventh century, which suggests the burials are of late ninth-, tenth- or eleventh-century date.

Included in burial database: Yes
Burials included: All

**References:** Collis 1978

**Winchester, Lankhills**

**Roman-Early Saxon**

- Hampshire SMR No: SU43 SE77A
- NMR No: 
- Parish: Winchester
- Date: c.310-410AD

In 1961, building work at Lankhills led to the discovery of inhumation burials. Subsequent excavations, between 1967 and 1972, uncovered 451 burials dating to the fourth and early fifth centuries. Among these were six atypical burials which exhibited features similar to those seen in early Anglo-Saxon burials and it has been suggested that these burials may form a late, possibly fifth century, group within the cemetery.

Included in burial database: No – burials predate 7th century

**References:** Scobie, Zant & Whinney 1991

**Winchester, Lower Brook Street**

**Middle Saxon**

- Winchester SMR No: 1002
- NMR No: 
- Parish: Winchester
- Date: c.650-750AD

This site was uncovered during the final year of the program of excavations of Lower Brook Street, 1964-1971, prior to the site's redevelopment. The cemetery at Lower Brook Street, which lies within the walled area, which was excavated in 1971, consisted of five graves, four of which contained bodies. Three of the burials contained grave goods: one accompanied by an iron object; another with a copper alloy buckle; while the occupant of the third grave wore an elaborate gold and garnet necklace. No evidence for the use of coffins or wooden lining was observed in any of the graves. The necklace has been dated to the second...
part of the seventh century, and the cemetery is thought to have been in use during the later seventh and early eighth centuries.

It has been suggested that the two burials found during the excavations of the late Saxon church of St. Pancras may have been an outlying part of the Lower Brook Street cemetery as the two sites lie less than 50 metres apart. However, the two burials have been radiocarbon dated to 710±80 AD and 860±60 AD, which suggests that while one of the burials is contemporary with and possibly part of the Lower Brook Street cemetery, the other is significantly later and may be linked to St. Pancras church, which is thought to have originated in the ninth or tenth centuries (see gazetteer entry for St. Pancras Church).

Winchester, Old Dairy Cottage

Middle-Late Saxon

Winchester SMR No: 7484
Hampshire SMR: SU43 SE115A
NMR No:
Parish: Littleton & Harestock
Date: 8th to 11th century

Cemetery
No. of burials: inhumations
Associated church: No
Associated barrow: No

In 1989, the construction and refurbishment of a barn at Old Dairy Cottage revealed a number of inhumations burials. They were recorded in situ and then fully excavated in 1990. Thirteen south-north graves, containing at least 17 burials, were excavated. Little care appears to have taken in the deposition of the body with a variety of body positions seen in the cemetery, including a prone burial. Four, possibly five, of skeletons were decapitated and the position of the arms of two individuals suggested their hands had been bound behind their backs. The site is flanked by a Roman road which formed boundary between the Bishop’s estate at Easton and the Chilcomb hundred in the tenth century. It is possible that the burial at Berwick House (see entry above may have been part of the same cemetery). Radiocarbon dating conducted as part of this study suggests a eighth- to eleventh-century

8 There is insufficient information to permit the re-callibration of either of these radiocarbon dates.
Old Minster was built was built in Winchester, probably in 648 AD, definitely by the 660s. The Old Minster was demolished in the late eleventh century during the construction of the new Norman Cathedral which partially overlies the older church. The remains of the Old Minster and part of its associated cemeteries were uncovered during excavations between 1962 and 1969 with a total of 748 inhumations, being excavated from within and around the church. There was significant variation in the funerary provision accorded these individuals. Evidence for the use of coffins was recovered from a number of graves in the form of coffin nails. Charcoal burials, pillow stones, iron coffin fittings, sand-lined graves and monolithic coffins were found among the Old Minster burials, with the most elaborate graves always found in prominent positions, such as inside the church and outside around the east and west ends of the church. While the vast majority of the graves in and around the Old Minster contained no grave goods, there are a few exceptions with items such as buckles, strap-ends and even a writing lead recovered from graves.

References:- Biddle 1964; 1965a; 1965b; 1966; 1968; 1969; 1970; Kjolbye-Biddle 1992;
In 1961, excavations of the cathedral car park, an area thought to lie within the precinct of the New Minster, prior to the construction of the Wessex Hotel uncovered an inhumation cemetery in the western end of the site. A total of 55 graves were excavated and dated to the ninth to eleventh centuries on the basis of stratigraphic evidence. The following years saw the excavation of small part of the New Minster church and its associated cemetery was excavated in the 1960s. A total of 109 burials dating between c.903 and 1110AD associated with the late Saxon New Minster have been identified from the excavations at the site of the Wessex Hotel and around the New Minster itself. Unlike the Old Minster, burial within the New Minster church seems to have been practiced from its earliest days (Biddle 1975:131), with many of the excavated graves lying within the church (Kjolbye-Biddle 1992:230). A quarter of the New Minster’s internal burials lay on charcoal beds, while 14.68% of external burials contained charcoal (Kjolbye-Biddle 1992:230). There was also evidence for the use of coffins with some graves containing iron nails and/or coffin fittings.

Excavations at Market Street in 1987-8 recovered the remains of close to 40 individuals (Teague 1988). This area is thought to have become part of the New Minster precinct during its expansion during Aethelwold’s reform of the minster. It seems likely that this area was used as a cemetery from the late tenth century until the New Minster was moved outside the city walls to a new site in 1110 AD, when it then became part of the cemetery of the medieval cathedral. While the lack of stratigraphy and datable artefacts makes it impossible to distinguish the pre-1100 AD burials from the later interments, a number of the lower burials have pillow stones and there is one charcoal burial. When this is combined with the fragmentary pottery evidence, it suggests that a number of these burials are of late Saxon date.

In 1990-1992, intermittent archaeological evaluation work taken prior to and during the landscaping of the area outside the West Front of the Cathedral and construction of a new visitors centre uncovered a total of 48 skeletons. The area is close to the location of the charnel chapel of St. Mary in the cemetery, which was built in the 13th century. The burials may be associated with this building or with its precursor which was uncovered during excavation and is thought to have been built sometime between the 11-13th centuries. Alternatively some of the burials may be part of the New Minster Cemetery. The presence of a charcoal burial in one of the deeper trenches suggests that late Saxon-early Norman burials may underlie at least of the excavated area.

In 1971, excavations were undertaken following the demolition of St. Thomas Parish Hall in Winchester, which was thought to overlie the city’s Roman South Gate. During the subsequent excavations of the Roman gate, two bodies were found in a ditch outside the city walls by the blocked and disused gate. One of the burials was interred in a supine extended position, while the other, whose skeleton exhibited the early signs of leprosy, lay on its side with the legs drawn up and it has been suggested this latter individual may not have had a
formal burial. No artefacts or dating evidence were found associated with the burials. Radiocarbon dates from one of the burials gave dates of 560-850AD and 490-820 AD, and a date of c.700AD has been suggested for the burials.

Winchester, St. Giles Hill

Early Saxon

Hampshire SMR No: SU42 NE68A
Winchester SMR No:294,297,774,775,1828
NMR No:
Parish: Winchester
Date: Early Saxon

No. of burials: At least 11 inhumations
Associated church: No
Associated barrow: No

A site of an early Anglo-Saxon cemetery with a number of furnished and unfurnished burials was uncovered in the area during 19th and 20th centuries on St. Giles Hill, Winchester. Burials possibly forming part of this cemetery include; the grave containing a "cup and paffen" uncovered prior to 1845 somewhere on St.Giles Hill (Win SMR 774), the skeleton accompanied by a "dagger" and a "large knife" found on the property of a Mr. Buckingham on St. Giles' Hill in 1884 (Win SMR 775), a skeleton accompanied by a sword discovered below the street surface of Northbrook Avenue in 1893 (Win SMR 297), six burials from 5 graves and grave goods, including 2 spearheads, an iron ferrule, a twisted silver ring and an iron ferrule, were uncovered while raising children's swings in 1905 in the grounds of Highland House (Win SMR 294), and an unfurnished burial found during the excavation of foundations for the extension of the house at Netherwood in 2000. There have also been a number of objects recovered from the area including a bronze sword pommel, an amber bead, glass beads, 2 shield bosses, iron buckle, a key?, a knife and a spearhead, which all likely to have originated from graves.

Winchester, St. Maurice's Church

Unknown
The site was subject to a salvage and rescue excavation following the demolition of the early Victorian Church in 1958 and prior to the site's redevelopment in 1961-2. St. Maurice's church is one of the city's earliest recorded churches, being mentioned in documents dating to the tenth century, and the excavation revealed the remains of church of probable twelfth century date, which overlay a masonry structure and a floor surface of pink plaster. It has been suggested that the masonry structure represented the remains of the Saxon church, but others have suggested that it is the remains of some form of domestic structure. Two graves, orientated approximately W-E (NB orientation of bodies unknown), were discovered which pre-date the twelfth century church and are cut into the pink plaster floor. The stratigraphy of the site suggests an eleventh century date for the burials.

Winchester, St. Pancras' Church

SMR No:
NMR No:
Parish: Winchester
Date: Middle-Late Saxon

Isolated burials?
N. of burials: 2 inhumations
Associated church: Yes
Associated barrow: No

The site of St. Pancras Church was investigated as part of the excavations of the area of Lower Brook Street, between 1962 and 1970 prior to the re-development of the site. The church itself was located in 1968, with the excavation of the pre-conquest levels (period I and II) occurring in 1970. Two, possibly three, west-east burials pre-date period II and are though to pre-date the conquest. One burial which lay below the north-west of the earliest church was radiocarbon dated to 710±70AD and it has been suggested that this burial, which clearly pre-dates the church may have form part of the late seventh- and eighth-century Lower Brooke Street cemetery, which lies less than 50 metres away. Alternatively, this burial and the two other may have formed part of a separate cemetery and given that one of the other burials has been dated to 860±60 AD, this cemetery may have continued in use until the ninth century. Finally, it is possible that the later of the radiocarbon dated burials and the undated burial may in someway be related to the church and it has been suggested that they may contain the remains of individuals closely linked to the church, perhaps involved in its foundation.

Winchester, St. Paul's Church
St Anastasius' Church

Winchester SMR No: 1294
NMR No:

Late Saxon

Cemetery
No. of burials: Four inhumations

88
Rescue excavations in 1972 at St. Paul's Church prior to the extension of the church hall uncovered evidence for the medieval church of St Anastasius and its graveyard. Excavations uncovered four, or possible five, graves (not fully excavated) probably representing part of the churchyard of St. Anastasius. The graves, which overlay settlement evidence of possible early medieval date, were built over when the church was extended in the late eleventh century and seem likely to be of late Saxon date.

Winchester, Staple Gardens

In 1984, excavations prior to development of a site, which lay within the walls of the late Saxon town close to the Westgate, uncovered the northern and western limits of a previously unknown cemetery. Another part of the same cemetery was uncovered in 1989, prior to the development of an adjacent site of 1-3 Staple Gardens and the adjoining Walcote buildings. A total of 288 burials were excavated. With the exception of a triple N-S burial, the burials were orientated W-E. The majority of burials were supine extended, although the cemetery also contained the crouched burial of an infant and five supine burials with flexed legs. Evidence of coffins or wooden linings, in the form of wood stains and/or nails was found in a number of graves and one grave contained a lead coffin of probable early medieval construction. In twelve graves, the skull was supported by stones, while seven burials had been placed on charcoal beds. The majority of the burials were unfurnished. Items, such as Roman coins and iron objects, were found in 12 graves. As the site overlay a Roman site that had produced large quantities of Roman coins, the coins in the graves may represent accidental inclusion as may the unidentifiable iron objects. However, in some cases, the coins were placed on the skeletons which may point to a degree of human involvement. Seven burials were radiocarbon dated and suggest a ninth- to eleventh-century date for the cemetery. No evidence for a church was uncovered during the excavations, but the medieval church of St. Paul, first recorded in 1256, is believed to lie in the vicinity and may have had late Saxon origins.

Seven burials were radiocarbon dated and suggest a ninth- to eleventh-century date for the cemetery. No evidence for a church was uncovered during the excavations, but the medieval church of St. Paul, first recorded in 1256, is believed to lie in the vicinity and may have had late Saxon origins.

In 1955, human bones were uncovered during levelling prior to the development of an industrial estate at Winnall. Over the next year a total of six graves were discovered and a formal excavation of the site was undertaken, conducted over two seasons. If the early discoveries are included, a total of 43 single and two double graves were uncovered. Twenty-eight of the 47 inhumations were accompanied by grave goods, of which 15 were accompanied only by a knife and/or a buckle. Wood stains indicating presence of a coffin or a wooden lining was observed in one grave, while one or two nails, possibly from some form of coffin or wooden lining, were found in three other graves. Five graves contained a few stones placed on the edge of the grave cuts while another six burials had stone coverings, which ranged from a few stones to a partial covering of the body. All of the bodies were orientated approximately west-east, with their heads to the west. Where it could be observed, all of the bodies were supine with legs, either extended or flexed, with the exception of the two individuals who lay crouched or flexed on their sides. The cemetery has been dated to the second half of the seventh century on the basis of grave goods.

| Associated barrow: No |

In 1944, inhumations were discovered when water pipes were laid for the American military camp, resulting in limited excavations that uncovered 5 inhumations. When the new owner planned to demolish the military camp, large scale excavations were undertaken in 1961-2. A total of 94 inhumation and 46 cremation burials were excavated. The majority of the inhumation burials contained grave goods including beads, brooches, buckles, knives, latchlifters, pursemounts, finger rings, shield bosses, spearheads and tweezers. Eight graves contained wood stains indicative of coffins or wooden plank linings and a number of burials had partial stone linings. All of the cremations were in urns. A number of urns also contained grave goods such as miniature toilet implements. The grave goods and presence of cremations suggest a early Saxon date for the cemetery.

Bowcombe Down, Carisbrooke

Isle of Wight SMR No: 449
NMR No: No
Parish: Carisbrooke
Date: Late 5th to 6th century

Between 1854 and 1859, eleven small mounds by a Bronze Age barrow were excavated and found to contain a total of seven inhumations and two cremations. Both inhumations were headless. One of the burials was accompanied grave goods, including a Roman brooch, a strap-end and a buckle. Four cremations were in urns, two of which have been illustrated and are clearly Anglo-Saxon. Another cremation without an urn, was accompanied by a “dagger”. A small cist was found in another of the small barrows. In 1858, the south-east part of the large Bronze Age barrow was levelled in preparation for the construction of a race course and three inhumation burials were discovered. This resulted in the excavation of the rest of the barrow and the discovered of a further nine to twelve inhumations and an unurned, possibly Bronze Age, cremation. Many of the inhumations in the Bronze Age barrow were accompanied by grave goods, which include swords, buckles, knives, beads, brooches, spearheads and spindle whorls. The grave goods associated with the burials in the Bronze Age barrow suggest an early Anglo-Saxon date for these burials. At least two of the urns found under the small barrows are also early Anglo-Saxon and it could be argued that the other burials under the small barrows are of a comparable date. However, one of the inhumations under one of the small barrows was accompanied by a Roman brooch and a strap end which has been dated by some to the 10th century. In 1979, human remains and a bronze buckle were discovered after ploughing in a field to the SW of the Bronze Age barrow. In 1994, a metal bowl was found in a hole close to the site of the barrows. Subsequent excavation demonstrated that the bowl was lying on the upper leg bones of an inhumation burial. Amber and glass beads lay below the bowl and a buckle lay over the pelvis. The burial was left in situ and the hole backfilled. The buckle suggests a 6th century date for this burial.

Sporadic finds of human remains and grave goods during marl digging on Chessell Down prior to 1816, including an inhumation burial with a sword. Excavations undertaken starting in 1816, led to the discovery of approximately 31 inhumation burials, many accompanied by grave goods including glass vessels, swords, spearheads, knives, buckles, brooches and beads. A second wave of excavations in 1818 uncovered further inhumation burials, again accompanied with grave goods. The site was rediscovered in 1855 and in excess of 50 burials were excavated. In total between 110 and 130 burials, including at least one inhumation, are thought to have been excavated from Chessell Down. The majority of burials were aligned NE-SW, and the many of the burials were supine extended. One grave was surrounded by stones and in other graves piles of flints were noted directly below the turf. Many of the burials were accompanied by grave goods but at least 35 graves were unfurnished. The grave goods suggest an early Saxon date for the cemetery.

-Isle of Wight SMR No:  
-NMR No: SZ38 NE37  
-Parish: Shalfleet  
-Date: Early Saxon  

In c.1816, an inhumation burial accompanied by three beads, a sword and a spearhead was found on Little Chessell Farm. The grave goods suggest an early Saxon date from the burial. In 1933, an inhumation, covered in large stones, was found above a quarry, ¼ of a mile from main road junction at Little Chessell. No grave goods or dating evidence were found in association with the burials, although an early medieval date has been suggested possibly as a result of its proximity to the earlier find.

Included in burial database: No – burial pre-dates seventh century

In 1904, a secondary inhumation was found within an ovoid cairn discovered the foundations for cottages. The male skeleton was aligned northeast-southwest. Fragments of at least six urns, probably prehistoric, animal bones and molluscan remains were also found. It is thought that the finds were all within an Bronze Age barrow and as such an early medieval has been suggested for the intrusive inhumation.

Abingdon I

Oxfordshire SMR No: 2902
NMR No: SU59 NW23
Parish: Abingdon

Early Saxon
Cemetery
No. of burials: 124 inhumations, 83 cremations
Associated church: No
In 1860, two disc brooches were found while digging foundations for a house in Abingdon. In 1934-5, part of a cremation urn and a shield boss were found by workmen when a trench was dug along Saxton Road in Abingdon. Subsequent excavations recovered a total of 82 cremation burials and 122 inhumation burials. All, bar three of the cremations were in urns. Many of the cremations contained grave goods including brooches and miniature toilet items. The inhumation burials were aligned in a number of different directions, but the majority lay west-east. Some of the graves contained wood stains, possibly indicative of the use of planks or coffins in the grave. Seven graves were covered by large stones. The majority of the burials contained grave goods, including knives, buckles, brooches, beads, shield bosses, spearheads, and swords. The grave goods suggest an early Saxon date for the cemetery. In 1935 a cremation urn, thought to be part of this early medieval, was found in Saxton Road and in 1935 and two further inhumation graves thought to belong to the cemetery were discovered in c. 1937 and 1942.

Date: Early medieval
Associated barrow: Yes

In 1976, excavations were carried out at Barrow Hills, Radley on the line of the proposed Abingdon peripheral relief road through Barrow 2. A secondary inhumation was founding the fill of the barrow's ditch. The extended burial was orientated with its head to the south and was accompanied by an iron knife. An early medieval has been suggested for the burial.

Barton Court Farm, Radley

Oxfordshire SMR No: NMR No: SU 59 NW 39
Parish: Radley
Date: 5th and 7th century

Excavations at Barton Court Farm at Radley prior to the construction of a housing development in the 1970s revealed a series of Iron Age enclosures, a roman villa with associated enclosures and evidence for an early Anglo-Saxon settlement in the form of 6 Anglo-Saxon sunken floored buildings and the traces of eight possible timber buildings. A total of 6 inhumations were recovered from the site. Two individuals were interred in the remains of the Roman villa. Another Roman building contained the double burial of a female and a newborn child as well as a single grave. These five burials were dated to the early medieval period, based on accompanying grave goods. A sixth unaccompanied burial uncovered in a Romano-British gully may also be of early medieval date.

Included in burial database: No – too early

Date: Late Roman/early Saxon? Associated barrow: No

In 1984, human remains were uncovered during ploughing in a field immediately to the east of the Iron Age hillfort, known as Sinodun Hill Camp. Subsequent excavations uncovered the remains of four inhumations. Other human remains have been reportedly found on the north and west sides of Castle Hill raising the possibility that a larger cemetery may have been associated with the hillfort. No datable artefacts were associated with the burials. A late Roman/early Saxon date for the inhumations has been suggested due to nature of the burial rites and the location of the burials.

Didcot Power Station

Middle Saxon

Oxfordshire SMR No:
NMR No: 
Parish: Didcot
Date: 7th century

An archaeological evaluation was conducted at Didcot Power station prior to further development in 1991. Following the discovery of an inhumation, excavation of the area uncovered a further 16 inhumations and two sunken buildings. One grave contained woode stains possibly indicative of a coffin or plank lining. The majority of burials were supine extended but four lay on their sides. The graves were aligned in a number of different directions with west-east and south-north being the most common. Thirteen individuals were buried with grave goods, including knives, buckles, a spearhead, a chatelaine, workbox, toilet set, rings, beads and shears. The grave goods suggest a seventh century date for the cemetery.

In 1864-5, human remains and artefacts, including spearheads and brooches, were discovered during quarrying at Frilford Heath. Subsequent investigations found 32 graves, some of which on the basis of their grave goods appear to be early Anglo-Saxon, while others accompanied by Roman brooches and coins or in lead coffins appear to be Roman. In 1867-9, a further 123 graves were excavated, including 10 cremation burials. In 1869-70, a further burials a further four burials were discovered. In 1912 another grave was discovered and in 1920 a further 45 graves were excavated and in 1937-8 another six burials were found. The inhumation burials consist of a mixture of Roman burials, which were orientated to the west-north-west and often unfurnished although some contained coins in their mouths, and early Anglo-Saxon inhumations and cremations, often accompanied by grave goods. The relationship between the Roman and Anglo-Saxon burials is unclear.

Excavations in Noah's Ark Field in 1937-8 uncovered the remains of an Iron Age and Roman settlement. The Roman settlement included a temple complex, an amphitheatre and a late Roman/early Saxon cemetery (Frilford-see above). In addition an isolated inhumation was uncovered to the south of the temple cut into a large Iron Age pit. The supine extended inhumation was orientated WNW- ESE and accompanied by a seax and knife. The narrow seax dates the grave to the seventh century. The grave contained 52 4th century Roman coins thought to have been part of a hoard, possibly disturbed by the Anglo-Saxon inhumation.

Date: Late 6th to 8th century

Middle Saxon

Isolated burial
No. of burials: 1 inhumations
Associated church: No
Associated barrow: No

An isolated burial laid in a grave, partially cut into the bedrock, was discovered c.1848. The burial was accompanied with a necklace of 2 amethyst, 23 glass and 1 Faience beads and a bronze ring. The grave goods suggest a late 6th to early eighth century date for the burial.
The earthworks and other features, including a barrow and an enclosure, on the top of Lowbury Hill were investigated in 1913-4. A supine extended inhumation burial, aligned with its head to the south was found in the centre of a barrow and is thought to be a primary inhumation. The male skeleton was accompanied by a bronze bowl, a shield boss, a comb case, an iron ring, a spearhead and a knife. The grave goods suggest a late 7th or early 8th date for the burial. A second supine extended inhumation burial was found in south-west corner of the enclosure. This female skeleton has been radiocarbon dated to the fifth to seventh century.

In 1832, skeletons and grave goods were found when graves were opened in North Field, Milton. The grave goods included a jewelled bronze and silver brooch, part of the rim of a hanging bowl, seaxes, a shield boss and spearheads. A further three skeletons, one accompanied by an iron object were found in 1947, 1949 and 1963 and are thought to be associated with the earlier finds. It has been suggested that the finds from Milton may represent two cemeteries, one dating to the sixth century and the other to the seventh.

The grave goods included a jewelled bronze and silver brooch, part of the rim of a hanging bowl, seaxes, a shield boss and spearheads. A further three skeletons, one accompanied by an iron object were found in 1947, 1949 and 1963 and are thought to be associated with the earlier finds. It has been suggested that the finds from Milton may represent two cemeteries, one dating to the sixth century and the other to the seventh.
In 1986, several inhumation burials were found in Denton College, Marcham. The college lies c. 50m from the church at Marcham and burial are thought to have once lain in the churchyard. It has been suggested that the church may possibly have late Saxon origins and as such, the burials are likely to be late Saxon or medieval.

Date: 5th or 6th century

In 1944, three inhumation burials were uncovered when a new gravel pit was opened at Sutton Courtenay. One of the burials was accompanied by a saucer brooch and three amber beads and these items suggest an early Saxon date for the inhumation. No artefacts were found in association with the other two burials, but given their proximity to the other burial, an early Saxon date seems probable.

During excavations of an Anglo-Saxon settlement at Sutton Courtenay between 1921 and 1937, an inhumation burial was found in a grubenhauser. The supine burial, with its head aligned approximately to the west, was accompanied by an iron knife and a bone comb and covered with a layer of clay. The grave goods suggest an early medieval date for the burial.

In 1826, an inhumation burial was found during gravel extraction by a road leading to Old Ford, close to the Thames. The burial was accompanied by five Iron Age brooches, a bronze ring, iron fragments, possibly from a sword and shield, and two pottery vessels. It has been suggested that this burial represents wither an unusual Iron Age burial or a cremation with brooches disturbed by a later crouched early medieval inhumation with a shield and sword.

Associated barrow: Possible

An inhumation burial was found by workmen in a small quarry on Barrow Hill in 1925. The find was reported to a local archaeologist and this led to the excavation of a second burial. The latter burial contained a female skeleton, orientated NW-SE, accompanied by two rings of silver wire and beads of amethyst, glass and white shell. The presence of amethyst suggests the grave dates from seventh or early eighth century. A further four or five burials had been found in the vicinity of these burials prior to 1925. A barrow, virtually destroyed by later road construction activities, may have stood in the vicinity of the site.

Banwell, Winthill

North Somerset SMR No: 106
NMR No:
Parish: Banwell
Date: Late Roman-early Saxon

Sporadic finds of inhumations, including one in a stone coffin, Roman coins, building materials and various other artefacts have been made at Winthill, Banwell from the 18th century onwards. Excavations between 1954-6 and 1963-4 uncovered a number of west-east inhumation burials. The burials lacked grave goods but a number of graves were edged with stones. A post-Roman date has been suggested for the burials.

References:

Bath Abbey

Bath & NE Somerset SMR No: BN 369
NMR No:
Parish: Bath
Date: Eighth to ninth century

When Abbey House was destroyed in 1755 to make way for the Duke of Kingston's Baths a number of skeletons were uncovered, some in stone coffins and many more in stone lined cysts. A hoard of 50 coins, from the reigns of Aethelred, Edmund and Alfred, was found in one of the coffins and a 9-10th century date for the hoard has been suggested. Excavations in 1896 recovered a rare example of a probable coffin plate of late Saxon date. In 1968, a single charcoal burial was found to the east of the East Baths thought to be of late Saxon date. Excavations at Kingston Parade discovered inhumation burials. In 1993, excavations in advance of the redevelopment of the vaulted cellars below the Kingston Building as a visitor centre uncovered a number of burials. 31 graves (this includes burials from Kingston Parade 1976 excavations) lay in the pre-Norman phase with radio-carbon dates from 3 skeletons suggesting a probable 8-9th century date for the burials. The graves were orientated west-east with some evidence for north-south rows. The burials were unfurnished with some of the graves containing beds of charcoal, pillow stones or foot stones. Evidence for the use of coffins, such as nails and coffin fittings, was found in a number of graves. The burials lie within Bath's Roman walls close to the site of the Norman abbey and possible site of the Anglo-Saxon abbey. The graves are thought to be linked to the late Saxon Abbey, although no archaeological evidence for the Saxon abbey has been uncovered. The charnel pits in the cemetery suggest that some burials were disturbed by the construction of the later Norman Abbey and its associated buildings. In 1994, small scale excavations were carried out in cellars below York Street, uncovered a minimum of three west-east inhumations including a charcoal burial and a Saxon wall, which may represent south precinct wall of the Saxon abbey. The skeletons between the wall and the abbey are thought to be of early medieval date. Excavations the following year immediately adjacent to the earlier York Street trench uncovered the other half of the charcoal burial. Also in 1995-6, excavations in the cellars of the East Baths prior to structural work uncovered four inhumation burials and disarticulated bones, including a charcoal burial. The burials are thought to be of late Saxon and medieval date. In 1999, further excavations were carried out in cellars in the East Baths and the remains of at least five west-east inhumations were recorded. Parts of two of these...
burials were uncovered in 1995. A large pit containing disarticulated bone was also discovered, which is thought to be charnel resulting from the construction of the Norman abbey. The similarities between these burials and their proximity to the site at the Abbey heritage Centre suggest a late Saxon date for these burials.

Included in burial database: Yes
Burials included: 31 burials uncovered during the excavations in 1993, including burials from Kingston Parade excavations in 1976.

Bath: St. James Church?
Crystal Palace Public House & 2 & 4 Abbey Street

Bath & NE Somerset SMR No:
NMR No: ST76 SE141
Parish: Bath
Date: Late Saxon –Medieval

Late Saxon-Medieval

In 1981, excavations were carried out prior to the extension of the cellars at the Crystal Palace Public House in Bath. Four inhumation burials, interred in plain earth graves, and fragments of disarticulated bone were discovered above lying above late Roman layers. The skeletal material from the cellar represented the remains of at least 8 individuals. In an attempt to understand the archaeology, the cellar of the adjoining house at 2, Abbey Street was also excavated in 1981-2. This cellar contains parts of a further 12 inhumation burials and disarticulated human bone from at least another 11 individuals. In 1982, the house at 4, Abbey Street was refurbished and a watching brief was kept when the floor of the cellar was removed. This led to the discovery of a further two inhumations. These burials clearly form part of a post-Roman cemetery. It has been suggested that the cemetery may have belonged to the church of St. James which is known to have stood in the vicinity until 1279. A late Saxon or Medieval has been suggested for the burials. The isolated skull found in an oven at 4 Abbeygate Street may represent displaced remains from this cemetery.

Bath: The temple of Sulis Minerva

Bath & NE Somerset SMR No: BN4905
NMR No:
Parish: Bath
Date: eleventh or early twelfth century

Late Saxon

A small inhumation cemetery was uncovered during the excavation of the Roman Temple of Sulis Minerva. The lower burials in trench 101 are thought to be of eleventh or early-twelfth century date as they lie above a demolition layer containing pottery of 10-early 11th century date and completely sealed by thick layer of deliberately dumped building rubble, iron stained clays and silts. This layer is thought to be related to the construction of a period 9 building, which is thought to be the infirmary built by Bishop Robert Lewes between 1137-1166, or the refurbishment of the King’s Baths in the 12th century. A second group of burials
in the area of the pump room, trench 105, have also been shown to pre-date the period 9 building and are thought to be part of the same cemetery. A total of 15 inhumations were dated to eleventh century/early twelfth century cemetery. All were unfurnished and orientated approximately west-east with evidence for the wooden linings or coffins present in some graves. The burials are thought to represent the southern fringe of a cemetery. It may possibly be associated with a church situated in the north-east corner of the Roman precinct - perhaps a late Saxon predecessor of the medieval church of St. Mary de Stall. Alternatively, the cemetery lies no more than 200m from the cemetery of the late Saxon abbey and these burials may form part of that cemetery.

Beckery Chapel

Somerset SMR No: 23570
NMR No: Inhumation cemetery
Parish: Glastonbury
Date: Sixth to ninth century

The observation of parchmarks indicating the presence of stone foundations led to the excavation of the site in 1887-8. These uncovered the remains of two chapels and six burials. In 1967-8 the site was reopened to re-examine the chapels and establish the extent of the associated cemetery. A total of 63 approximately west-east burials were uncovered. Six of the burials were prone with the remainder being supine where body position was known. All, bar three, of the skeletons analysed were male, the exception being the remains of an adult female and two children. All of the graves were unfurnished and there was no evidence for the use of coffins, wooden lining or pillow stones. The earlier timber chapel is thought to be associated with the cemetery and a single burial lay within it. This grave provided the only example of a stone lined grave from this site and this combined with its location suggests it contains the remains of an important individual. The second chapel was built in the late tenth or eleventh century and is thought to post-date the cemetery. Radiocarbon dating of one of the burials suggested a middle Saxon date for the cemetery which when combined with stratigraphic evidence suggests the cemetery was in use during the eighth and ninth centuries.

Included in burial database: Yes
Burials included: 58 – as there was insufficient information to include five of the burials.

Brean Down

Somerset SMR No: 10131
NMR No: Inhumation cemetery
Parish: Brean
Date: Fifth-seventh/eighth-century

Discoveries of human remains were first recorded from the sandcliff at Brean Down in 1902. Further finds of human remains were made between 1930 and 1959, including 10 burials during the 1950s. The discovery of two gold Bronze Age bracelets during a Bristol University Geography department field trip in 1963 and possible stone structures and the
human pelvis identified during the recording of the site in 1964, led to fully scale excavation of the site, which was being eroded by the sea. The 1985-7 excavation uncovered eight west-east unfurnished burials, some of which had partial stone linings. Radiocarbon dating indicates a fifth to eighth century date.

Included in burial database: Yes
Burials included: 8 burials recovered during excavations between 1983-7 and published in Bell (1990).

Camerton

Bath & NE Somerset SMR No: BN1145
NMR No: Inhumation cemetery
Parish: Camerton
Date: seventh-century & possibly sub-Roman.

In 1926, human bones were uncovered during quarrying at Camerton. As any remaining burials were under threat from the ongoing quarrying, the site was completely excavated between 1926 and 1932. A total of 107 graves, including 2 double graves, containing 116 inhumations, some accompanied by grave goods, were excavated. The majority of graves were orientated west-east. Where body position was known, the majority of burials were supine extended although two lay on their side and three were prone. Three graves contained complete or partial linings while five graves had stones placed over the grave. The grave goods suggest a seventh-century date for the cemetery, although there is a possibility that some of the unfurnished burials may be sub-Roman.

Included in burial database: Yes
Burials included: All

Cannington

Somerset SMR No: 10503
NMR No: Inhumation cemetery
Parish: Cannington

Roman-middle Saxon
Human remains have been recovered from Old Cannington Quarry since the nineteenth century. Although some excavations were conducted in the late nineteenth and early twentieth centuries, it was estimated by the mid twentieth century that at least 1000 burials had been destroyed by quarrying. Quarrying at the site ceased in 1939 although excavation continued with two skeletons being recovered in 1946 and a skull being discovered in 1957. In 1961, work resumed in the quarry and more skeletons were uncovered with 20 skeletons being excavated by the sons of the quarry foreman. During 1962-3 large scale excavations were undertaken on an area under threat from quarrying. A further 17 burials were excavated by amateur archaeologists in 1964-6. In total, 542 burials were recovered during excavations between 1962-6. The majority of burials were supine extended and orientated approximately west-east. Stone linings, stone covers and/or grave goods, mainly knives, pins, beads and Roman coins, were present in some burials. Radiocarbon dates and the grave goods suggest the cemetery was in use during the fourth to eighth centuries.

Included in burial database: Yes
Burials included: Only Rahtz’s phases D, E & X.

The Chapel of St. Ethelreda may have been founded in the tenth-century, continuing in use during the medieval period. Documentary sources suggest that the chapel had its own cemetery. Tradition places on the site of the Methodist Chapel in Wells and the human remains recovered during construction of a vestry at the back of the current chapel may have been part of the churchyard of the late Saxon-medieval chapel.

One of the group of round barrows on Tump Field, Charmy Down was opened two or three times during the nineteenth century. The barrow (Grimes barrow 6), which was covered oolitic boulders and slabs, contained a probable primary cremation in a stone-lined cist and four secondary inhumations, probably of early medieval date.

Church of St. Mary Magdalene

Somerset SMR No: 57051
NMR No:
Parish: Keinton Mandeville
Date: Unknown

Inhumation cemetery
No. of burials: Unknown
Associated church: Yes
Associated barrow: No

The demolition of a boiler room built into the angle of the nave and Tower at the NW corner of the Church of St. Mary Magdalene in Keinton Mandeville and the subsequent construction of toilets and a kitchen on the same site was subject to archaeological monitoring in 1998. Excavation of foundations for the new building uncovered three grave cuts with additional grave cuts observed in a number of service trenches. The graves were not fully excavated and there was no dating evidence for any of the graves.

Clevedon, Walton Road

SMR No:
NMR No: ST 47 SW 43
Parish: Clevedon
Date: Unknown

Inhumation cemetery?
No. of burials: At least 3 inhumations
Associated church: Possibly
Associated barrow: No

Human remains were found in the grounds of a cottage on Walton Road in 1958. Prior to this, at least three other skeletons had been found in the general vicinity, in a line extending from the grounds of the Grove to the Calvary. None of the burial contained any grave goods and no evidence was recovered to date any of the burials. The inhumations may have been associated with the Chapel of St. Peter mentioned in documentary sources or they may be associated with the late Roman coins recovered from a nearby quarry.

Daws Castle

Somerset SMR No: 34164
NMR No: ST 04 SE 1
Parish: Wachet
Date: 5th century??

Isolated burials
No. of burials: Unknown
Associated church: Unknown
Associated barrow: Unknown

A number of west-east orientated unfurnished burials were discovered on the site of Daws Castle during the nineteenth century. The burials were thought to be of fifth century date and possibly of Irish origin. Daws Castle consists of the remains of a once extensive enclosure. The enclosure does not appear to have been of Iron Age date and a Saxon date has been suggested, with Daws Castle possible being the site of the burh of Weced (Watchet).
The remains of six individuals were uncovered at Doulting while digging shallow foundations for a small house in 1925. Five of the extended burials lay in a N-S line with their heads to the west, with the sixth individual lying a few feet to the west. No artifacts were associated with the burials. An early medieval date was suggested by an examination of the bones at the time, but in the absence of any other dating evidence, this is insufficient criteria to securely date the burials.

References: Gray 1925

Human remains were discovered during alterations at Wayside Cottage, Edington. The disarticulated remains represented only part of a skeleton of an individual between 12 and 18 years. No dating evidence was recovered.

References: Somerset Archaeology 1978

16 grave cuts arranged in two rows were identified in an evaluation trench during an archaeological evaluation in 2000. The graves were orientated approximately west-east or SW-NE and only one grave was partially excavated with the remainder left untouched. The date and full extent of the cemetery are unclear. The burial ground may be associated with the late Saxon and medieval settlement found at Eckweek farm and the organisation of the cemetery suggests a Roman or later date.

There have been 34 seasons of excavations at Glastonbury Abbey between 1904 and 1979 and few have been fully published. Inhumation burials have been recovered in a number of these excavations, but the main focus of many of the excavations lay not on the burials but on structural features. Many of the burials have been recovered from the area of the “ancient cemetery.” This area is thought to be the location of the one of the Abbey's earliest burial grounds and some of the burials from this area may be of early medieval date. A number of burial were sealed by a layer of clay which is thought to be associated with St. Dunstan's heightening of the area in the 10th century. Many of these graves are roughly lined with slabs of lias limestone and covered with slabs which would have lain level with the ground surface. In addition, a small stone structure filled with rubble was found below the 10th century tower and it has been suggested that this may have been a hypogeum or burial crypt. A stone coffin containing the partial remains of at least 17 individuals was found in the hypogeum.

Included in burial database: No – insufficient information
Burials included: None

References: - Rahtz & Watts 2003

An archaeological watching brief was conducted during the extension and modernisation of the existing house at 2 Church Lane for use as a Church Hall. The remains of a single W-E inhumation were uncovered along with evidence for a possible second grave cut. The graves were not fully excavated and the bones were left in situ. The burials were sealed by 12th century occupation deposits, suggesting a pre-12th century date for both burials. The burials are thought to be part of graveyard of St. John's Church, which lies to the east of the site. The few loose human bones were recovered from across the development area provide additional evidence suggesting that the original extent of the church graveyard lay further west than the current boundaries. Furthermore a ditch, probably dating from no later than the eleventh century, uncovered during the excavations may represent the original western boundary of the churchyard or it might represent an early property boundary.

Included in burial database: No – insufficient data as grave not fully excavated.
Burials included: None

References: - Holinrake & Holinrake 1996;1997c
Among the features uncovered during the excavations of the summit and part of the shoulder of Glastonbury Tor in 1964-6 were two graves. The graves were orientated north-south, with the heads to the south, and are thought to be associated with the fifth-seventh century occupation of the Tor, which includes evidence for timber buildings, a large hearth and large quantities of animal bones. Although the dating of this phase of occupation of the Tor was based on the presence of imported Mediterranean pottery, c.600AD, there is no direct dating evidence for the graves. The nature of the settlement on the Tor in this period is far from clear but a monastic settlement is currently the favoured model due in part to the present of a later seventh/eighth century monastery on the same site.

Included in burial database: No – burials most likely pre-seventh century.

Early-middle Saxon

Inhumation cemetery
No. of burials: 73 inhumations
Associated church: No
Associated barrow: No

The site lies on a prominent spur adjacent to the hillfort of Cadbury Congresbury. The site is part of an area riddled by mining for iron ore during the post medieval period and human remains are known to have been uncovered as a result of these activities. When the Henley quarry was extended in 1961-2, stone foundations and burials were uncovered, which led to large-scale excavations in 1964, 1968 and 1969. The majority of the burials were supine extended and orientated approximately west-east, although there were a few north-south burials. There were no grave goods although nails were found in a number of graves which may be indicative of coffins or other wooden structures within the graves. Many of the graves were partially or fully lined in stone, although in some cases this may represent stone displaced when the grave was cut into the bedrock. Radiocarbon dating suggests that the cemetery was in use during the fifth to seventh centuries.

The disturbed remains of at least 10 individuals were uncovered in the foundation trenches of a new house on the south of the St. Peter's Church, Langford Budville. The nature of recovery meant it was difficult to determine orientation but it is assumed to have been approximately W-E. No artefacts were found in association with the burials and there is no dating evidence. The site lies on a hilltop which is dominated by the present church and churchyard. This site is separated from the current church by a road and it is thought that the churchyard may have once extended across the road, although there is no cartographic or historical evidence to confirm this. If these burials were once part of the church cemetery, this would suggest a possible late Saxon or medieval date for the burials.

Portishead

Roman-Early Saxon
North Somerset SMR No: 446
NMR No:
Parish: Portishead
Date: Roman-Early Saxon

Inhumation cemetery
No. of burials: At least 43
Associated church: No
Associated barrow: No

The site was discovered by a local archaeologist during the levelling prior to the construction of a block of garages in 1968. At least 43 inhumations were recorded. All burials were supine extended, orientated west-east. Some graves were lined with irregular slabs of stone. The only grave goods were a single stud and an earring. The latter is probably of late Roman date. The lack of grave goods, the lack of grave furniture and the general appearance of the burials and the cemetery suggest a late or sub-Roman date, c.400-700AD, for the cemetery.

Shapwick I

Somerset SMR No: SU01 SE42 A&B
NMR No:
Parish: Shapwick
Date: 9th to 12th century

Cemetery
No. of burials: Unknown
Associated church: Yes
Associated barrow: No

Human remains had been occasionally recovered during ploughing in Old Church Field, Shapwick, the site of the Old Church prior to the construction of a new church in the fourteenth century. In 1993, the site was excavated as part of the Shapwick project to confirm the site of the church and assess the condition of the buried remains. Disarticulated human bone and burials were uncovered during these excavations, including evidence for burial in coffins with nails and stone capped graves. One grave was completely excavated to assess the condition of the skeletal material. A burial, which lay against the south wall of the church, was radiocarbon dated and gave a late Saxon date.

Shepton Mallet, Fosse Lane (I-V) Roman-Saxon/Unknown

Somerset SMR No: Inhumation cemetery
NMR No: ST 64 SW 62
Parish: Shepton Mallet

Excavations prior to a major commercial and residential development on the east side of Fosse Way in Shepton Mallet in 1990 uncovered the extensive remains of a Romano-British settlement. The site also contained three cemeteries of late Roman/early Saxon date and two groups of isolated burials, one of mid-late Saxon date and the other of unknown date – see below for details.

Shepton Mallet I Roman-Early Saxon

Inhumation cemetery
No. of burials: 5, possibly 6, inhumations & 1 cremation.
Associated church: No
Associated barrow: No
Date: 4th century, possibly continuing in use to 6th or 7th centuries.

A small cemetery of five graves and possible grave, lying was uncovered within the Roman-British settlement. A cremation was found in a cooking pot in a sub-circular depression cut through an earlier boundary wall. One of the inhumations lay in a lead coffin, while another was interred in a stone coffin contained within a stone mausoleum, while other graves contained iron nails suggesting the presence of wooden coffins. Associated Roman pottery and the stone mausoleum suggested a 4th century date for the cemetery, but a radiocarbon
date of 420-767 AD\(^9\) at 2\(\sigma\) for the burial in the lead coffin raises the possibility that the
cemetery remained in use into the early Saxon period.

Included in burial database: No – too early.
Burials included: None

References:- Leach 2001

Shepton Mallet II

Isolated burials
No. of burials: 3 inhumations
Associated church: No
Associated barrow: No
Date: 8th-10th century

2 shallow graves containing the badly disturbed remains of 3 individuals were cut into the
remains of one of the rooms of a Roman building. Both graves lay approximately W-E and
there was no evidence for coffins or grave goods. One of the burials gave a radiocarbon date
of 722-990AD\(^{10}\) at a 2\(\sigma\) sigma level of confidence suggesting a eighth to tenth century date
for the burials.

Included in burial database: Yes.
Burials included: 2 individuals - insufficient information on third body.

References:- Leach 2001

Shepton Mallet III Roman-early Saxon

Cemetery
No. of burials: 16 inhumations
Associated church: No
Associated barrow: No
Date: 3\(^{rd}\) - 4th century, possibly continuing in use during 5\(^{th}\) and 6\(^{th}\) centuries.

A small cemetery of 16 inhumations was uncovered lying within a Roman sub-rectangular
compound. A number of graves were lined with limestone packing and contained iron nails
suggesting the presence of coffins. One individual had been interred in a lead coffin. One of
the graves contained a cross shaped silver amulet punched with a chi-rho monogram dated to
c.400AD. Radiocarbon dates from two burials of 70-410 AD\(^{11}\) and 260-593AD\(^{12}\), both at a
2\(\sigma\) sigma level of confidence, suggests a Roman date for the cemetery with the possibility
that burial may have continued into the 5\(^{th}\) and 6\(^{th}\) century.

Included in burial database: No – too early.
Burials included: None.

\[^{12}\text{GU-5295} = 1610\pm 60\text{BP}\]
Cemetery
No. of burials: 9 inhumations
Associated church: No
Associated barrow: No
Date: 4th/5th century, possibly continuing in use during 6th and 7th centuries.

A small cemetery of 9 inhumations was uncovered lying in the west of excavated part of the settlement. A number of graves were lined with limestone packing and others contained iron nails suggesting the presence of coffins. One individual had been decapitated with their head placed by their left foot, while another burial was prone. Two individuals had iron hob-nails by their feet, one of which gave a radiocarbon date of 430-680AD\textsuperscript{13} at a 2\sigma sigma level of confidence. This suggests a late 4th or 5th date for the cemetery with the possibility that burial may have continued into the 6th or 7th century.

Included in burial database: No – too early.
Burials included: None.

References:- Leach 2001

Shepton Mallet V Unknown

Isolate
No. of burials: 1 inhumation
Associated church: No
Associated barrow: No
Date: Unknown

An isolated badly disturbed and poorly preserved single burial found in the south of the excavated part of the settlement, in an area containing a series of Roman enclosures. No dating evidence was present, but a post-Roman date has been suggested for the burial.

Included in burial database: No – not securely dated.
Burials included: None.

References:- Leach 2001

South Petherton Infants School Late Saxon-Medieval

Somerset SMR No: 55868
NMR No: 
Parish: South Petherton
Date: c.12th century

Archaeological monitoring during the construction of an extension of South Penderton Infant School uncovered two W-E inhumations in 1996. A fragment of pottery dating broadly to the 12th century was found in one grave cut. The site is immediately to the east of the eastern boundary of the parish churchyard and the two burials uncovered were probably interred within the medieval churchyard before later encroachment.

Included in burial database: No – probably medieval.
Burials included: None

132
St. Bridget's Churchyard

Somerset SMR No: 10037
NMR No: ST 25 NE 24
Parish: Brean
Date: Late Saxon –Medieval

Late Saxon-Medieval

Inhumation cemetery
No. of burials: 3 inhumations
Associated church: Yes
Associated barrow: No

Plans to construct a free-standing vestry to the south-east of the chancel of the church of St. Bridget at Brean led to an archaeological evaluation within the cemetery. While the earliest structural features date to the thirteenth century, the isolated position of the church combined with its Celtic dedication to St. Bridget and the presence of a spring suggest the site may date back to the early medieval period. 3 inhumations, one in a coffin, were uncovered under the 19th century bank which encloses the church. A scatter of bones was found to the east of the burials, under the west edge of the ditch. The burials may predate the inundation of the site by sand and may be medieval or earlier.

Included in burial database: No – not securely dated
Burial included: None

St. Michael's Church, Haselbury Plucknett.

Somerset SMR No: 57052
NMR No:
Parish: Haselbury Plucknett
Date: Unknown

Unknown

Inhumation cemetery
No. of burials: 1 (possibly 2) inhumations
Associated church: Yes
Associated barrow: No

A single inhumation burial was recorded during excavations for a drain in the north-west corner of nave of the current church in 1998. The burial lay under a wall which formed part of the 19th century extension of the nave, indicating a pre-19th date for the burial. No other dating evidence was recovered. Two flat stones recorded in the trench may have covered an additional burial. Both burials would have lain in the churchyard outside the church prior to the 19th century extension. The current church was built on the site of an earlier church, which dated from at least the twelfth century.

Included in burial database: No – dating not secure

In the summer of 2000, excavations conducted as part of the South East Quantocks Archaeological Survey (SEQAS) to the east of Stoneage Barton Farm, Bishop's Lydeard located a single grave shaped feature. The orientation of the grave and the presence of stone lining suggested that it might be part of a post-Roman cemetery. The cemetery lay outside the SEQAS project's remit but due to the sites potential importance to the understanding of the post-Roman period excavation of the site was undertaken by the county council in the autumn of 2000. Evidence for an additional 2 graves and two probable graves was identified. Bone preservation was poor due to the acid soil, but grave size combined with evidence from surviving bones suggests the graves contained the remains of four adults and a child. All the burials were unfurnished with three of the four adult burials lying within square enclosures. Wood stains suggesting the presence of coffins or wooden lining were observed in two graves and incomplete stone linings were found in four of the five graves. Radiocarbon dating suggests the cemetery was in use during the 7th century.

As part of a programme of resurfacing and enhancement of the eastern end of Castle Green, excavations immediately beside the west face of the north pier of the medieval gate located an inhumation in 1985. The in situ W-E burial was at a depth of approximately 1m with only the head and shoulders visible. Given it's proximity to the Castle Green cemetery – a burial ground thought to be associated with the late Saxon Minster - the burial is thought to probably be of Saxon date.

Burials in the area of the Taunton Castle have been uncovered since the 19th century. The earliest recorded discoveries were the human bones and skulls uncovered during the construction of wooden structure for the circus in c.1838. Other nineteenth century finds included human bones found during digging drains in 1867 and the laying of gas mains in 1868. Human bones were recorded in section of a trench cut by the Castle Gateway in 1867 and were found in large quantities under the Cattle Market, which was sited in the former outer bailey of the Castle, in the late nineteenth century. Ground disturbing activities also uncovered human remains in 1874, 1893 and 1900.

During the twentieth century, human bones were noted in flower beds c.1958 and there were occasional finds of human bones during the excavation of the Camera in the 1960s. Fragments of human bone representing four adults and an infant were recovered from a wall foundation trench during work on the boundary wall between the Castle Garden and Castle Green at the west side of the Castle Entrance in 1972. In the same year, the installation of a drainage sump on the east side of the Castle Entrance uncovered human remains including two skulls. Also in 1972, during the conversion of the former Coin room of Taunton castle into a local history library, the excavation of shallow trenches in the rubble layer below the floor revealed human skeletal remains representing at least 18 individuals. In 1978, human remains were found on the north side of the inner Ward. In 1977, one of the library site trenches were re-opened to obtain a sample of bone from one the skeletons left in situ for radiocarbon dating. The radiocarbon date 860±70AD suggested a late Saxon date and suggests the large quantities of human remains recovered from around the castle are from a late Saxon cemetery lying beneath the castle. It has been suggested that the cemetery may be associated with the late Saxon Minster thought to have stood somewhere within the castle precinct.

Included in burial database: No – insufficient data on burials
Burials included: None

The skeletal remains of at least 2 individuals were found in 1970 during laying of a gas main at the junction of Corporation and Tower Streets. Prior to 1929, Tower Street was narrower and the excavated area would have originally lain within the garden of St Paul's House. In 1989, the additional remains of three inhumations, 2 adults and 1 juvenile, were uncovered during the excavation of a service trench during a watching brief on the Eastern side of St. Paul's House. The W-E burials have been tentatively dated to the late Saxon period due to their proximity to other burials in this part of Taunton thought to date from this period. These burials lie in the vicinity of the site of the late Saxon minister. Alternatively, St Paul's
House is supposed to overlie the site of the medieval chapel of St. Paul's, founded between 1180 and 1217, although there is no evidence that the chapel ever obtained burial rights.

Somerset SMR No: 44493
NMR No: Isolated burials
Parish: Taunton
Date: Late Saxon-medieval ?

A large quantity of human bone was uncovered during the excavation of the foundations for a gasometer in 1868. The site lies to the west of the cemetery at Castle Green. It is unclear whether these remains have any connection to the Castle Green cemetery, a burial ground which may have been associated with the late Saxon Minster. Alternatively, it is possible that this skeletal material may represent the formal re-interment of remains from the Castle Green cemetery disturbed by the construction of inner and outer moats of the castle in the 13th century.

Date: Late seventh to early eleventh century

Fragments of human bone were recovered during a watching brief of the construction of the Bowden Reservoir link water pipeline in 1991. This resulted in a small-scale excavation which recovered the remains of 11 individuals. The graves were orientated approximately east-west and cut into the cornbrash bedrock. All burial were supine, with 9 having extended legs and two with flexed legs. The burials were unfurnished and there was no evidence for the presence of coffins or wooden linings in the graves. The small cemetery was dated to mid-late Saxon period by radiocarbon dating.

A burial, perhaps a cremation, accompanied by six small yellow metal bowls was found within a large vessel with two metal handles while ploughing a field in 1855-6. Parallels have been made to "Scandinavian" burials where there are examples of large vessels containing shield bosses resembling bowls and burnt bones. However, the location of the finds is now unknown and the burial cannot be securely dated.

Wells Cathedral

Somerset SMR No: 15381
NMR No:
Parish: Wells
Date: Early medieval-medieval

Inhumation cemetery
No. of burials: 316
Associated church: Yes
Associated barrow: No

The extension of the mason’s yard and work to improve the drainage around the eastern cloister led to large scale excavations of the Camery at Wells Cathedral in 1978-80. A total 316 articulated burials dating from the Roman to late medieval period were recovered with 242 dated to the Saxon or Norman periods by a combination of stratigraphy and radiocarbon dating. The burials were orientated west-east and contained no grave goods. Evidence for the use of coffins or wooden linings, in the form of wood stains and nails, was observed in a number of graves. In addition, there were a few examples of stone lined and plaster lined graves, and the occasional examples of head niches and stone grave markers.

Included in burial database: Yes
Burials included: Phases 2 (middle Saxon) and 3 (late Saxon-Norman) only.

Wembdon

Somerset SMR No: 12470
NMR No: ST 23 NE 61
Parish: Wembdon
Date: Middle-Late Saxon

Inhumation cemetery
No. of burials: At least 22
Associated church: No
Associated barrow: No

The cemetery was discovered in 1984 when 3 inhumations were disturbed during the construction of an extension to 100 Wembdon Hill. An additional two burials were uncovered when a water pipe was laid from the extension to the road. Excavations by the Bridgewater and District Archaeological Society in 1985 uncovered the foot end of one of the previously known burials. In 1986 a tinned copper alloy penannular brooch, thought to date from 5-6th century, was uncovered when a tree root was dug out. In 1987, a flower bed in the front garden was excavated revealing an additional two inhumations. Later that the same year, further bones were uncovered in a foundation trench for a revetment wall in the back garden and the remains of a further burial were lifted. Later that summer, a large trench was opened in the back garden and a further 4 burials were recovered. In 1988, further archaeological investigations in the front garden of 100 Wembdon Hill uncovered another part of one of the previously excavated burials. A watching brief in the adjacent property of 98 Wembdon Hill uncovered disarticulated human bone but no intact burials or grave cuts were observed. In 1990, a further W-E 10 burials arranged in two rows were disturbed when the owner of 102 Wembdon Hill dug foundation trenches for an extension. Unfortunately,
the owner had disregarded the planning laws and the burials were only recorded during a site visit by the Bridgewater and District Archaeological Society as the owner neared the end of his excavations. Finally, a watching brief at 110 Wembdon Hill revealed no evidence that the cemetery extended as far as that property. Where known, the graves were orientated west-east and the bodies were supine and extended. Several graves contained evidence for coffins or wooden linings and a few were partially stone lined. The majority of graves were unfurnished, although one burial contained a shroud pin and another a strip of iron. Radiocarbon dating suggests the cemetery was in use during the late sixth to twelfth century.

Included in burial database: Yes
Burials included: 12 articulated burials. The disarticulated remains, from 98 Wembdon Hill, were not included. The 10 burials from 102 Wembdon Hill were also excluded due to lack of detailed information.

Cemetery
No. of burials: 45 inhumations, 1 cremation
Associated church: No
Associated barrow: Possible

A Saxon cemetery was discovered during road widening work to the north of Downton in 1981. After 12 burials were salvaged in difficult condition, construction work on the site was halted to allow a full archaeology investigation. A total of 42 graves, including 4 double burials, and a single cremation were discovered. The majority of graves were aligned west-east, although eight lay south-north and three north-south. Flints were used to partial line 3
graves and a number of graves contained evidence for the use of plank linings. Many of the burials contained grave goods and these items suggest that the cemetery was in use between the late fifth and early seventh century. A low mound lies to 15m to the south-west of the excavated area may have been the remains of a barrow.

Collingbourne Ducis

Early-Middle Saxon

Wilshire SMR No: SU25 SW400
NMR No:
Parish: Collingbourne Ducis
Date: 6th to mid-7th century

An inhumation was discovered by builders working on a housing development in summer of 1974 when disturbed by machinery. Another 3 graves were then excavated prior to main programme of excavation. In addition, a number of burials were discovered after the archaeological evaluation as the result of deep trenching with 33 graves, containing 35 individuals, being uncovered in total. A single cremation urn was also recovered from the subsoil of one of the graves. Twenty of the graves contained grave goods. The grave goods suggest a sixth- to mid-seventh-century date for the cemetery.

Included in burial database: No – many of burials pre-date seventh century.

Burials were uncovered when the area to the south of St. Swithin’s Church in Compton Bassett in 1993. A late Saxon or medieval date has been suggested for the burials. A further three west-east burials were partially uncovered during an archaeological assessment of the church in 2001. The bodies, which were planned but not lifted, predated the construction of the aisle in the thirteenth century and are unlikely to predate the first phase of church construction in the eleventh century.

In 1803, evidence for a primary inhumation was found when one of four barrows near to the point where the Roman road crosses the Old Sarum-Shaftesbury road. The barrow contained a large oblong pit which contained grave goods but no body. The grave goods included a sword in the remains of a wooden scabbard, two bronze pyramid studs, three spearheads, two iron knives, a shield boss, bronze and iron buckles, rings of gold and silver wire, a gilded bronze handled bowl and two glass vessels. The grave goods indicate an early seventh-century date for the burial.

Before 1931, part of a human skeleton was found on Nursteed Road in Devizes and there are reports of other finds of human remains in the vicinity. No dating evidence was reported to have been found with any skeletons. In 1931, a pot, possibly of Romano-British date, was found also found in the vicinity. It has been suggested the burials may be of Romano-British date, and possibly linked to the Roman settlement some 800m away.

**Ford Laverstock Barrow 1**
(also known as Ford 17)

Wiltshire SMR No: SU 13 SE 401
NMR No: SU 13 SE 6
Parish: Laverstock
Date: Late 5th to early 8th century

An early Bronze Age cremation was discovered during agricultural activities. A circular earthmark suggestive of a barrow was observed surrounding the site of the cremation. Subsequent excavations uncovered the remains of a barrow ditch around a primary grave which contained the Bronze Age cremation. The tip of an iron sword, a bronze strip and unburnt human bones were also recovered in the immediate vicinity of the cremation. This suggests that the burial mound may once have contained a secondary inhumation of Saxon date with all traces of the grave being obliterated by ploughing.

Included in burial database: No – burial may pre-date the seventh century.
Burials included: None

References:- Musty 1969

**Ford Laverstock Barrow 2**
(also known as Ford 18)

Wiltshire SMR No: SU 13 SE 401
NMR No: SU 13 SE 6
Parish: Laverstock
Date: late 7th or early 8th century

A second circular earthmark was observed c.25 meters to the south-west of Barrow 1 (Ford 17) at Ford, Laverstock (see above for details of the excavation of barrow 1). Excavation of this second earthmark, referred to as barrow 2 of Ford 18 revealed a large grave lying in the entry of a penannular ditch. The grave contained the remains of an adult male accompanied by two spearheads, a shield boss, a bronze hanging bowl, a bone comb, a seax within a sheath and a buckle. The grave goods suggest the grave dates to the second half of the seventh or early eight century. The presence of the ditch and the absence of any prehistoric finds suggests that the grave lay below a Saxon barrow.

Malmesbury Abbey Late Saxon

Wiltshire SMR No: ST98 NW400 & 427
NMR No: ST98 NW67
Parish: Malmesbury
Date: 11th-12th century

The remains of three burials were revealed when an existing water pipe trench across
Malmesbury Market Cross was re-opened in 1993. The burials lay approximately W-E. The
bone condition was poor and the burials were left in situ with a bone fragment removed for
radiocarbon dating. Analysis produced a date range of 1030-1220 AD at a 2σ level of
confidence. An excavation trench opened for further assessment of the site uncovered a
further three burials. These were not fully excavated, although part of each skeleton was
uncovered to determine that the graves were orientated W-E.
Archaeological observation of structural engineers test pits was conducted on the site of the proposed Ivo Fuch's Centre in 1996. Human bones were observed in two of the pits, some of which may have been in situ. There was no dating evidence recovered but the proximity of this site to the Malmesbury Market Cross site, some 50m away, may indicate that these remains are also of late Saxon date. Both sites lie close to the site of the Abbey church and its burial ground and, as such, the burials are thought to have been part of the presumably larger late Saxon burial ground associated with the abbey.

**Monkton Deverill**

SMR No: ST83 NE401  
NMR No:  
Parish: Kingston Deverill  
Date: 7th century

A watching brief undertaken by Wessex Archaeology during the construction of the Codford-Illchester water pipeline in the winter of 1989/90 led to the discovery of an inhumation cemetery. 15 graves were excavated in advance of the pipeline. The burials were orientated with their heads to the west or south-west. With the exception of one burial which contained a knife, the burials were unfurnished. One of the burials lay in the centre of an annular ditch, which may have contained a barrow. A number of graves had partial stone linings and one grave contained an organic stain, perhaps indicative a timber within the grave. The cemetery has been dated to the seventh century on the basis of the type of grave goods and other characteristics. The excavated graves are thought to lie on the periphery of a much larger cemetery.

Late Saxon

Isolated burial

No. of burials: 1 inhumation

Associated church: Yes

Associated barrow: Yes

In 1885, the Bronze Age barrow lying in the corner of the churchyard at Ogbourne St. Andrews was opened. A large number of skeletons, all orientated with their heads to the west, lay some 2-3ft below the surface of the barrow. These burials were thought to be part of the medieval churchyard. At a depth of 5ft below the surface of the barrow lay a single male skeleton lying in the remains of a coffin made of fir with iron coffin fittings, orientated with its head to the south-west by west. The coffin fittings suggest a late ninth- or tenth-century date for the burial.

Early Saxon

Four secondary inhumations were discovered during the excavation of a Bronze Age barrow on Overton Hill in 1962. Three of the burials were accompanied by grave goods including two shields, a spearhead, two knives, brooches and beads. Finds of disarticulated bone and fragments of grave goods in the barrow suggest there may have been further secondary inhumations within the barrow. The grave goods suggest a fifth- to sixth-century date for the burials.

Included in burial database: No – burials pre-date seventh century.

NMR No: Purton
Date: Late seventh- to eighth-century

Middle Saxon

Cemetery
No. of burials: 6 or 7 inhumations
Associated church: No
Associated barrow: No

In the 12 to 14 years prior to 1912, 6 or 7 skeletons were discovered during quarrying in a field opposite “The Fox” farmhouse, in an area a short distance to the east of the Purton Church. One of these burials was apparently accompanied by 3 coloured glass beads, but no additional information is available. In 1912, a further 4 graves were discovered. The first burial was complete and accompanied by a seax, 2 knives and a blue annular bead. The second burial was incomplete with only the legs below mid thigh being present and was accompanied with a Fe spear head. A third burial, complete except for feet was accompanied by a knife and the fourth, a juvenile burial, with no surviving grave goods, had been largely removed by quarrying activity. A further 2 inhumations were uncovered in 1925 accompanied by a spearhead, knife and bone pin. The grave goods suggest a late seventh- to early eighth-century for the cemetery.

Quidhampton

Wiltshire SMR No:SU13 SW400
NMR No: SU13 SW117
Parish: Quidhampton
Date: 5th or 7th century

Early-Middle Saxon

Isolated burials
No. of burials: 2 inhumations
Associated church: No
Associated barrow: No

Two graves were discovered when a North Sea gas trench excavated. One burial had its head to the west and the other head lay to the south-west. Grave goods, which were partially recovered from the spoil heap included two applied brooches, a glass bead, a bronze pin, a bronze clip and an ivory ring with associated objects of iron and bronze which lay by the waist. It has been suggested that the graves are fifth century, but the ivory ring may have
been part of bag holding small items at the waist and these are usually dated to late seventh or early eighth centuries.

Included in burial database: No – burials may pre-date the seventh century

The three small barrows on Roche Court Down were opened in 1931 after the discovery of an undated execution cemetery in the vicinity (see Roche Court Down I for details). Barrow 2 contained a large turf lined cist containing a supine extended male skeleton, orientated with its head to west-north-west. The skeleton had been covered with a thin layer of turf and the cyst was then filled with chalk rubble. The burial was accompanied by a knife in a scabbard, two pieces of iron, possibly a buckle or clasp and a leg of mutton. The location of the burial and the grave goods suggest a sixth- to eighth-century date for the burial.

Included in burial database: No – burial may predate seventh century

During excavation of Roche Court I and II, a few human toe bones were observed in a rabbit burrow some 40 yards to the north of Roche Court Down II. Excavation at this site uncovered 13 graves containing the remains of 16 individuals. The graves were orientated approximately west-east. There was no evidence for the use of coffins and only three graves contained grave goods, two with knives and the third interred with a leg of beef. One of the graves contained ledges along all the sides of the grave at a height of 16 inches above the base of the grave. The type of grave goods and mode of burial seen in the cemetery suggest a late sixth to early 8th century date for the cemetery.

Isolated burial

No. of burials: 1 inhumation

In 1723, a skeleton was uncovered during tree planting on the top of Silbury Hill. Six weeks later, a bridle, an iron knife and deer antlers were also recovered. The bridle was initially
dated to the ninth and tenth century, although it now seems more likely to date to the
eleventh century. It has been suggested that the bones and the bridle might be part of a
Viking burial. However, it is not clear if the human bones and the bridle were recovered
from the same part of Silbury Hill. Moreover the bones were not necessarily contemporary
with the bridle and may have dated from the prehistoric period.

Date: 6th to early 8th century

A secondary inhumation, accompanied by a spearhead or arrowhead, was discovered when a
Bronze Age was excavated prior to 1812. The grave goods suggest an early to middle Saxon
date for the burial. The location of the barrow now is unclear, but one of the barrows thought
to be this barrow was excavated again in 1941 and a further three skeletons were uncovered.

Included in burial database: No – burial may pre-date seventh century

South Tedworth, Zouch Cottages                               Unknown

Wiltshire SMR No: SU24 NW550    Isolated burial
NMR No: SU24 NW64
Parish: South Tedworth
Date: Saxon?

In 1987, an inhumation was discovered in the side of a military trench cut into the side of a
round barrow at Zouch Cottages, South Tedworth. The burial was supine extended, aligned
north-south, and accompanied by an iron knife. The presence of knife suggests that the burial
may be early medieval.

Date: 7th century

A decapitated skeleton was discovered in 1923 to the north of the south barrow at Stonehenge during a programme of excavations between 1919 and 1926. It was one of three skeletons discovered during these excavations and the only one thought to be still extant. The remains of the decapitated individual were initially thought to be Neolithic or Roman and were thought to have been destroyed by wartime bombs. However, the skeleton's recent re-discovery and the ensuing radiocarbon analysis have shown it to be 7th century.

Date: mid-10th to 12th/13th century
Associated barrow: No
Excavations were carried out on the site of Trowbridge castle prior to redevelopment of the area. The initial excavations were limited designed primarily to assess the degree to which the castle survived below ground. A late Saxon church and graveyard was identified during these initial investigations. Almost a decade later large scale excavations were undertaken on the site of the castle between 1986 and 1988. A total in excess of 280 skeletons of late Saxon and medieval date were recovered during the excavations. 162 burials, many sealed by the defences of the anarchy period castle, were dated to between c.950 and 1139. The graves were all orientated with their heads to the west. There were no grave goods in any of the graves or any evidence for the use of coffins, although one grave had stone packing around the head and shoulders of the inhumation and a wooden plank appears to have been laid above the stones. Stones or skull were used to support the head of ten, possibly fifteen, inhumations and one burial lay on a bed of charcoal. Many of the graves had been partially cut into the underlying cornbrash and a few had partial stone linings.

In 1960, three graves were uncovered while digging a pipe trench. A further 7 graves were subsequently located and excavated by Salisbury Museum. In 1992, a sword was discovered during the construction of two bungalows some 30 metres from the burials discovered in 1960. The following archaeological excavation located a further 23 graves, with only those graves directly affected by the construction work being fully excavated. Later the same year, a further 24 graves were fully excavated prior to the construction work on an adjacent property. A further 21 burials were located between 1992 and 1994 while monitoring the installation of water pipers and electricity cables and during the construction of garage belonging to one of the properties. Only those under directly threatened by the building work were fully excavated. In 1997, an additional 7 burials, 4 of which were fully excavated, were located prior to the construction of bungalow on land adjacent to the properties excavated in 1992. In total, 85 graves have been located between 1960 and 1997. 37 of these have been excavated. The majority of the graves are orientated west-east and contain supine extended burials, although at least 2 graves were orientated south-north and one of the burials lay face down. Many of the burials contained grave goods. While detailed analysis of the grave goods from the graves excavated in 1990s has yet to be completed, they appear, like those excavated in 1960, to date from the fifth and sixth centuries

Included in burial database: No — predates 7th century.

Witherington  

Early-Middle Saxon  

Wiltshire SMR No: SU12 NE401  
NMR No: SU12 NE19  
Parish: Alderbury  
Date: Late 5th to 7th century

Isolated burial  
No. of burials: 1 inhumation  
Associated church: No  
Associated barrow: Yes

In 1874, a skeleton, orientated north-south, was discovered in a lynchet below the earthworks at Witherington Ring. The burial was accompanied by a sword, spearhead or ferrule, shield, knife and a strike-a-light and covered by large stones. The burial lay some 20 meters from a barrow. The grave goods suggest an early to middle Saxon date.

Included in burial database: No – burial may pre-date seventh century  
Burials included: None

Woodbridge Inn, North Newnton  

Early-Middle Saxon  

Wiltshire SMR No:SU15 NW400  
NMR No: SU15 NW7  
Parish: North Newnton  
Date: late 5th to early 8th century

Isolated burial  
No. of burials: 2 inhumations  
Associated church: No  
Associated barrow: No
In 1935, two skeletons were uncovered during road widening work at Woodbridge Inn. The skeletons are thought to have lain close together with their head to the west and there were a number of blackened stones at the west end of the grave. The skeletons were accompanied by a shield boss and spearhead. The grave goods suggest a late fifth- to early eighth-century date for the burials.

Included in burial database: No – burial may pre-date the seventh century
Burials included: None

An inhumation burial was discovered in a barrow at Yatesbury in c.1743. The skeleton was found below a large stone just below the surface of the barrow. The body lay in a stone lined grave and was accompanied by a gold ring, spearheads and a piece of brass. The grave goods suggest an early or middle Saxon date.

Included in burial database: No – burial may predate the seventh century.
