APPENDICES

Martin Agricola: - MUSICA INSTRUMENTALIS DEUTSCH

(Wittenberg, 1529, reprinted New York, 1969.)

Chapter 14 (No pagination)

About the third type of musical instrument, whose melody is produced neither by pipes nor strings, but primarily by striking, as a bell. The third type comprises all instruments which are made of metal and other materials which ring, as a hammer rings on an anvil, such as cymbals, xylophone, little bells and other instruments like them.

(There follows, under the caption 'Anvil with hammers', a picture of an anvil on a large stone slab. Three hammers lie nearby.)

How Pythagoras has calculated by means of their proportions various intervals, such as the octave, fifth, fourth amd unison, from hammers struck on an anvil, and how he discovered their relationships, one with another.

Worse things could be undertaken than to write yet a little more about the four hammers which Pythagoras fiddled about with (was P. hat mit gerriben). He once went into a blacksmith's house, where he heard the lively ringing of hammers. They were being struck on the anvil, and the strokes fascinated him.

1) He weighed the first and fourth hammer, which showed him the octave, because the first sounded so strongly as to cause the other to ring.

2) Then he weighed the first against the third. The first was one and a half times heavier than the third, just as the teacher told us. From these the third hammer was heard to sound what in singing is known as a fifth.

3) The first was tested with the remaining hammer, and whether struck one after the other or both together, the interval of a fourth was sung.

4) The second hammer was calculated to be a sesquioctave from the third hammer. He recognised the sound as that named in song, the whole tone.

> Thus up to present time, it has been through hammers that the octave, fifth, fourth and whole tone were discovered. I am not the only one to set down these things, but I have got my information from books which the ancients have written, which we must believe, if that is possible. The present author's account is clearer than those of his predecessors.

There follows a picture of Pythagoras in Medieval costume weighing hammer heads in a huge pair of balances. The caption reads: 'Pythagoras weighs the hammers, one with another, and notices by how much one is heavier than the other, and also notices what sort of resonance comes from them.'

There follows on the next page one of the diagrammatic forms of 'The Lyre of Mercury'. The four hammers are mounted on a plinth inscribed with the notes each one gives out, and their relationships. The caption reads: 'The proportions, weights and resonance of the four hammers.'

> (The chapter is written in rhyming couplets, a format reserved for the dedicatory and more poetic parts of the book, which otherwise is written in prose.)

Arnolt Schlick: SPIEGEL der ORGELMÄCHER und ORGANISTEN.

(Speyer 1511, reprinted Mainz 1959.)

The reprint, in facsimile, is bound with a complete translation of the original into modern German by Paul Smets. There is no pagination in the original, and so page references to the modern German translation are given. Except for the last two paragraphs, which deal exclusively with the right time of year to tune organs, I have translated the whole of chapter 8, which contains everything which Schlick has to say concerning temperament.

Chapter 8

Page 89 (in modern German)

THE EIGHTH CHAPTER deals with the tuning of the organ: at what time the tuning ought to be carried out, how every rank of pipes from the highest to the lowest position ought to be tuned, how intervals and chords are to be constructed, how the unison, 5th, octave, 4th, 6th and third are to be treated, the intervals by means of which all vocal and instrumental music is produced. How the intervals referred to are to be arranged and classified into perfect and imperfect intervals does not need to be set out here, for that is the duty of the composers and musicians who have frequently discussed such matters. Although the said intervals are completely pure in themselves, and desired to be tuned exactly without beats, and although in solo playing they sound best in pure tuning, nevertheless no two intervals ever sound pure together, if each interval is absolutely pure itself. For instance, if one wishes to tune C - G as a pure fifth, so that the third E which lies between sounds pure as a minor third, a major tone and a half's distance from G, the major third or ditone from C will not be pure, but too high. If the fifths are tuned without beats, the thirds as already mentioned, become too wide, so that they sound frightful and shrill. You can test that in the following way:

Take F, and then four fifths one on top of another, so that the last fifth gives an A, which as major third-double tenth, and as double sixth, against F and C respectively, is too high. But if you make all the thirds pure, then the

fifths will be too high. If you take four thirds one on top of another, thus : C - E - G - B♮ - D, you can find the size of the fifths. It is just the same with other intervals. For instance, three major thirds one above another are good in themselves. The last sound occurs on the octave of the first, but in comparison is indeed too low, not high enough when considered as C - E - G♯ or A♭ - C. If one takes a purely tuned fifth, and joins it with a further purely tuned fourth above it then the last sound in comparison with the first is too high, and gives a sour octave. For instance:

too high

C - G - C

5th 4th

If you then take four consecutive fourths, e.g.

P.90. G - C - F - B♭ - E♭ the E as the sixth or double sixth to the G will fall too low. Consequently, since the intervals in themselves are pure, but disturb each other in harness, one must make a small adjustment to each, and so seek to unify them, that one may help to make the other bearable, as will be explained later. In this manner the dissonance known to organ builders as "wolves" will be distributed as well as possible in such places as will least offend the ear. Pipe organs or positives, whether with pipes made out of metal, wood, paper fabric, glass or otherwise, and furthermore the other musical instruments strung with metal or gut strings, such as clavichords, harpsichords, hurdy-gurdies, lutes, harps and others more, which possess semitones, not one of these can be beat-free and fully concordant in the tuning of all their notes. Therefore, not only in our time, but without doubt, in much earlier times, a great deal of energy and diligent work has been expended on how to reduce these shortcomings and defects. There has been built during these twelve years an organ which possessed double semitones in both manual and pedal. If the usual semitones were too high or too low, then the others, known as 'half semitones' or 'ignoten' would eliminate this flaw, by means of different pipes and choirs. It was in vain, futile and could not be used. And so this

innovation was removed from the organ. This curious idea was not expiated with negligible costs. The two organ makers who built the aforesaid organ thought to accomplish something original which would bring them recognition from other organ builders. They had tried to do the same many times before but lacked the skill. It is just the same when organists, wishing to learn a new method, and wanting to accustom themselves to a new style of playing, in my opinion accomplish nothing from it.

Now as my statements refer to no-one personally, and as the organ is needed to be playable, I have tried faithfully to give organ builders purposeful and necessary instructions as to how to tune and temper the organ. My instructions are not solely for the organ maker, but also

P. 91. intended for the organist. Perhaps there are a few organists among us who have a special inclination in these matters, and enough experience to demonstrate them to the organ builders, in order to help them and to be able to perform good service to the perfecting of their organs.

Begin with F on the manual and take the fifth above(C) not quite so high as to be perfectly in tune, but let it beat somewhat below, so that the ear can hear it, but not so much that it is easily recognised when struck as a fifth. If the fifth is struck and held a moment a somewhat more fluctuating hiccup-like sound is to be heard, which will not become stable and always seeks to unite in absolute purity. As soon as the C is tempered, then tune the fifth above (G) exactly the same, and again the fifth above the G, namely D. But refrain from taking the fifths any higher, because the pipes become too small. Continue with the D you tuned last, and tune the octave below, without taking from it any of its purity. Then go up a fifth from D to A and let it beat on the flat side, as much as can be borne, and after that from A tune E exactly the same, and after that the octave below E pure. The fifth above E, the B♮ must be held on the flat side also. As soon as the above keys or notes have been tuned, tune all the octaves above and below E. Then you have tuned the basic notes with each other. There is a reason for the

fifths having to stand and beat lower than pure, against their will. If they were desired to remain pure, the thirds would be too sharp, and in order to avoid this, the fifths must be allowed to beat on the narrow or low side. Every note which is tuned pure with the fifth below it, like E with A, turns out to be too high. One recognises that fact if one strikes E with its major third below (C) and just the same with the others, etc. Although the major thirds are not pure, but collectively too wide, care must be taken that the three most important ones, namely C - E, F - A, G - B♮ are tuned more pure, as good as their corresponding fifths will allow. These three thirds will be used more frequently than the rest. By as much as the three named thirds are better than the others, so will G♯ in comparison with A and B♮ be the poorer. But G♯ is not so important as the three thirds mentioned, and there is more to be said about the G♯ later.

P.92. There is still something to be said about the semitones, B mollen or conjuncten, as they are also known by. Start again with the previously tuned F, take its fifth below, B♭, and temper it to the F so high that the fifth is acceptable in its beating, and so that at the same time it makes a tolerable third with the D above it. Do exactly the same with the fifths E♭ (post re) and A♭ (post sol), so that they agree with the thirds G and C lying between them by being tuned higher. If one wished to do otherwise by tuning the fifths pure, then the thirds would sound instead very uncomfortable if they were not helped by the fifths beating on the high side. When the B♭ has been tuned thus, take the fifth below it, E♭ or D♯, call it what you will, also beating on the high side against the B♭ above it, as instructed in the foregoing fifth, and then tune the octave pure above this E♭. To this E♭/D♯ tune the fifth below A♭/G♯ (fa in elamire post sol oder gis), instead of on the high side, rather lower than the fifth requires, so that together with E and B♮ it helps to make a good cadence on A. Nevertheless the G♯ tuned like this will scarcely give a good third or sixth to the fifth E - B♮

in a cadence on A. If a full close, as it is called, is required, a major sixth, a sixth consisting of a major tone and perfect fifth must precede. At this place more than at any other the G♯ is to be tolerated, for just because it is a cadence, the counterpoint does not require the G♯ to be held as long as the other voices, and in this form of cadence one can get over this difficulty by a momentary pause, perhaps a diminution, a little decoration or run, hesitation or flourish, so that the harshness of the often mentioned cadence is not so obvious. An able organist knows how to do this sort of thing well. It is a different matter with the other consonance G♯ D♯ C (post sol post re C solfaut) since this is not used in a cadential progression with C♯ (post ut), but it is played on the organ as a different chord incidental to the coming together of the three or four voices of the counterpoint. So it is necessary that notes are tempered and tuned (eingezogen un gestimpt) so that they can fulfil the requirements of the music; the arrangement of the semitones has not been made to no purpose. But certain people support another opinion. They say it is better to make the G♯ pure to the E and B♮ in order to make a cadence on A, than to be compatible with C and E♭(post re). But it seems strange to me, that by so doing they harm the music, and want to rob it of its particular quality, namely the

P. 93. sweetness of good and unfamiliar harmonies. Without the semitones these chords are not possible to the same extent; they cannot be formed so concordantly without them, a statement which cannot be denied. But even if these people cannot use these chords euphoniously, their use, in the hands of other organists whose playing incorporates these semitones is without doubt a delightful and happy experience to all people who have a discerning ear. Therefore it ought to be a matter of wonder and praise, rather than an opportunity for scorn and contempt. On these matters I have talked much and often with the most famous of musical theorists and practising musicians, men whom I have always held in high esteem, and I have found many of them in agreement with my view. Some organists

and organ builders, who formerly did not agree with my method and strove vehemently against me have meanwhile come round to my way of thinking. Organs installed since that time are evidence of their embracing my method in practice. Now if particular organists belonging to the old guard have for a long time regretted their mistake, without wanting to admit it, and persist in their set ways (yren eilff augen beharren), then the organ builder ought to yield to them without further ado, and so tune the organ as is required of him. As far as everything else that is required of him, he has done his duty.

Continue then at B♮ and let the rest of the semitones follow. Thus tune the fifth above the B♮ the F♯ to beat gently on the low side, so that F♯ as the third between D and A, as the major sixth above A, and its fifth below, D, is tolerable and not too high, because the cadence on G is often required and in common use, whereas the chord using the fifth B - F♯ is not considered and seldom used. Then to F♯ tune the fifth above, C♯/D♭, so that together with A and E the chord can be used as an approach to D. Admittedly this C♯ will be too low against the fifth above, G♯, but that does not matter, since it is not used, even if someone wishes to go through all the musica ficta. There is never any need for all the semitones. None of our composers write songs so completely dependent on foreign notes. Truly if someone out of curiosity and delight in the esoteric wants to indulge in semitones, if he then requires the first mode on B♭ or the fifth mode on E, then the organist is not obliged to play at the required pitch, but may transpose up or down in consideration for the semitones. C♯ and G♯ (post ut und post soll) have undoubtedly the greatest harshness.

The rest of the chapter discusses the best time of year to tune organs.

Michael Praetorius: SYNTAGMA MUSICUM vol.2. DE ORGANOGRAPHIA.

(Wölfenbüttel,1619, reprinted Kassel, 1958.)

Part II Chapter 36 CLAVICHORD.

Pages 60 - 61

Praetorius describes the instrument, its range, and the disposition of the keyboard of twelve notes per octave. One of its merits, he says, is that it provides a foundation and basic skill, after which many other instruments may be learned more easily.

P. 61. This year I have to deliver to a worthy master a clavichord similar in size and shape to that shown in Plate XV no.2. On his clavichord not only are the keys D♯ and G♯ duplicated, but also C♯ and F♯, and even between the keys E and F and B and C there is yet another special
P. 62. semitone to be found, just like the universal harpsichord (Clavicymbalum Universale) which is described more fully in Chapter XL.

(End of Chapter 36.)

Chapter 40 THE UNIVERSAL (OR PERFECT) HARPSICHORD.

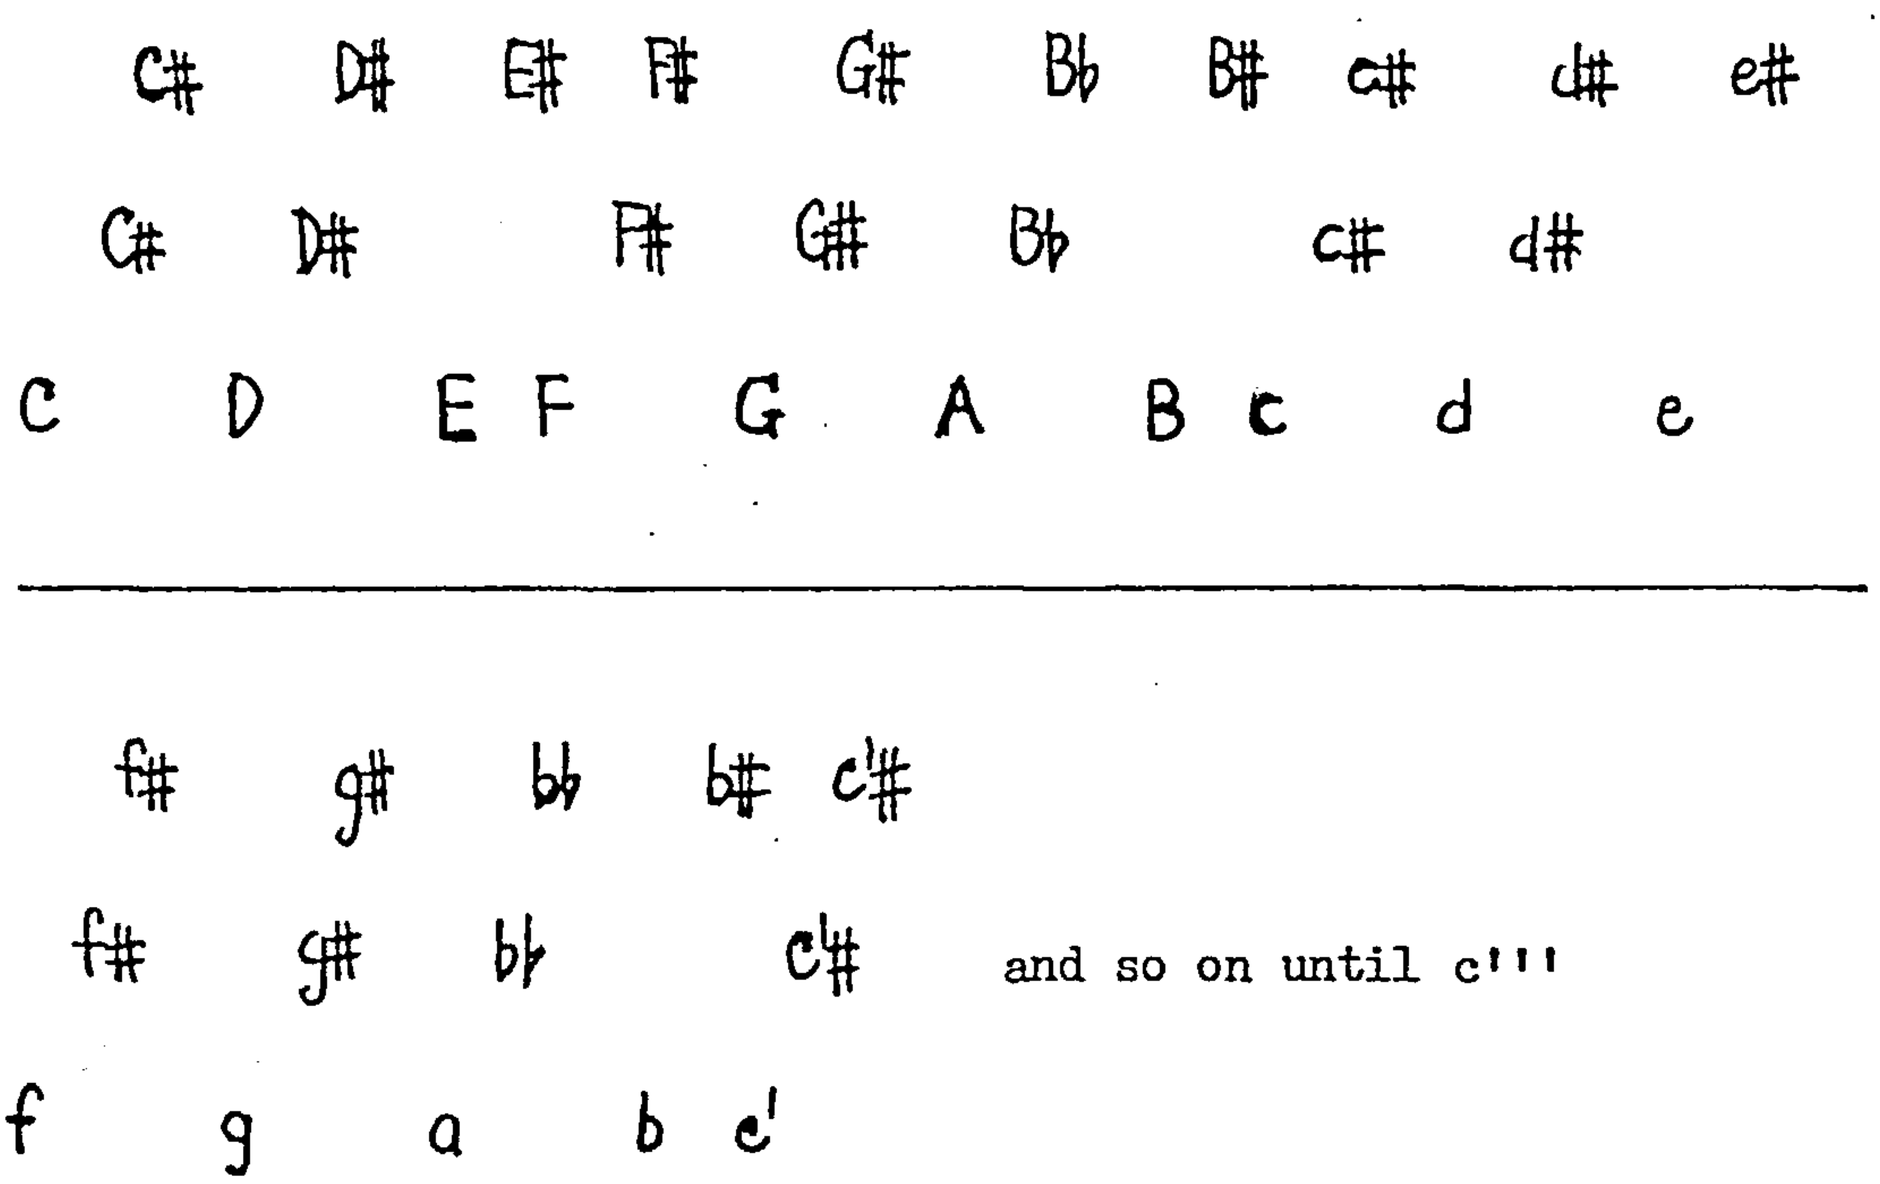
P. 63. Whereas the harpsichord, symphony and similar instruments ought to be classified as less than perfect in that the chromatic genus cannot be achieved on them, as it can on the lute and the viol da gamba, a number of harpsichords and symphonies have been produced before now for discerning organists, on which the D♯ key is divided and duplicated so that one can have a pure and just third between B♮ and D♯, a necessary modification if the Aeolian mode is to be transposed down a perfect fourth.

In my humble opinion, this would be just as useful and necessary on positives and organs as it is on harpsichords etc., for which one needs only to retune the strings by slackening them off, and later put them to rights.
Besides the D♯ key, let the G♯ key be divided and

duplicated to facilitate playing in the hypodorian mode, for when this mode is transposed down a tone from G to F, the minor third above F, adjacent to G♯, is then made really pure. Other similar modifications for the chromatic genus are equally feasible.

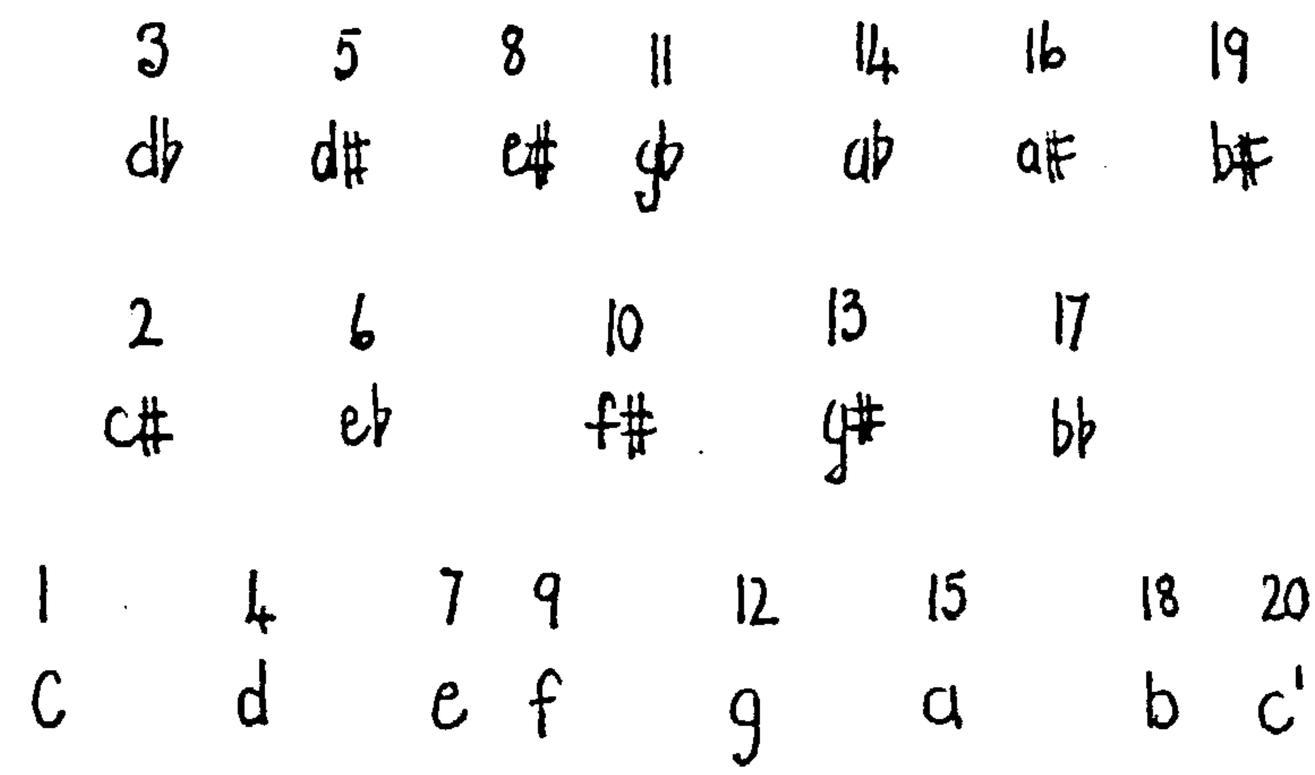
Now I have seen in Prague, in the house of Herr Carl Luython, the famous composer and organist to his imperial Roman majesty, a harpsichord strung with multiple strings (mit AEQUAL Saitten bezogen) and made some thirty years ago with great skill and diligence in Vienna. On it not only were the semitones B♭, C♯, D♯, F♯/G♯ divided throughout, but even between E and F there was a further SEMITONIUM (a name sometimes given in these circumstances), which is a necessary component to the enharmonic genus. Thus in the four octaves from C to c''' there are 77 keys in all.(+)

Since it is both extremely difficult to find or even see an instrument of this kind, I think the following diagram may not be completely superfluous.

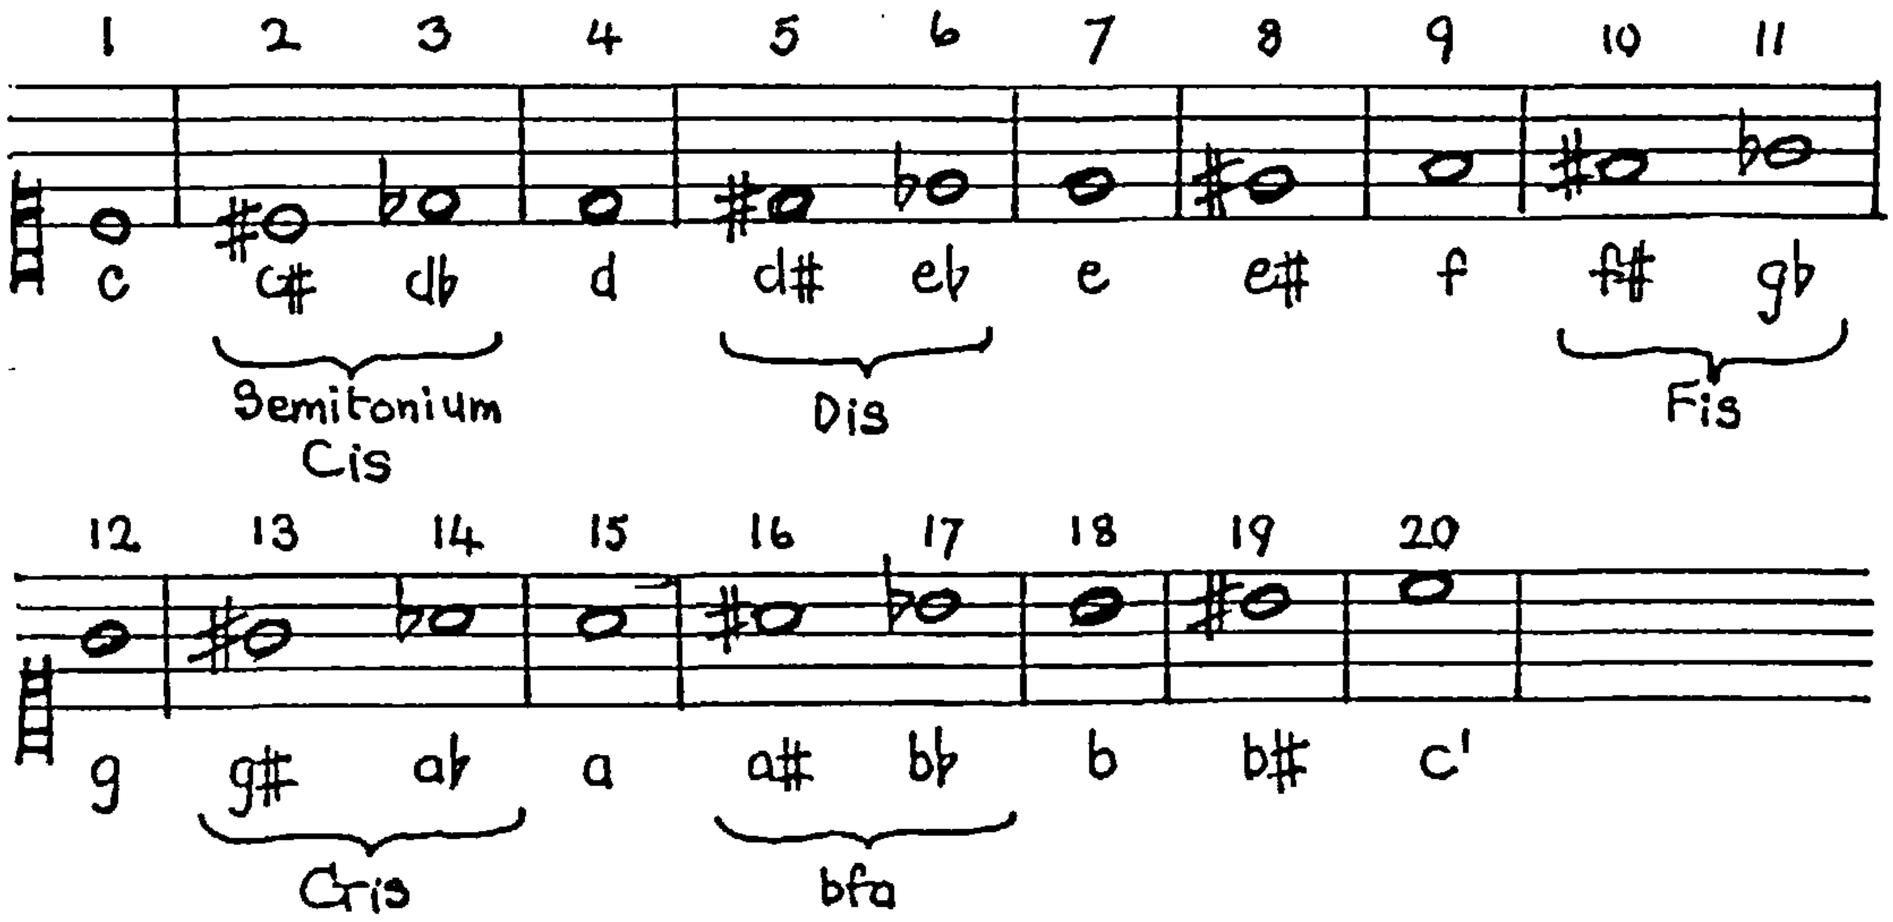


(+) Praetorius assumes, but fails to mention, a SEMITONIUM between B and C in the text, but shows it in his diagrams.

Whereas in the above diagram the keys and semitones are seen to be distinguished one from another more by reference to the old key names rather than from the vocal aspect, where the natural HARMONIA is produced from the written notation, I have humbly taken it upon me to present another diagram of the keyboard, which presents the facts in a more appropriate way.



P. 65. By this means everyone can find out the notes more easily and correctly and apply them to the tablature. Such notes are needed in some of the madrigals of that famous and industrious composer Luca MARENZIO, which use the chromatic genus. This further diagram gives the notation.



This harpsichord or instrument has within the interval of three degrees of the scale seven small steps, viz., C C♯ D♭ D E♭ D♯ and then E, with which hardly any other instrument can compete by playing so accurately in tune. By these means all three genera, diatonic, chromatic and enharmonic can be faithfully reproduced on it. Thus it would be fair to call this a perfect instrument, if not a supremely perfect instrument, because these precise subsemitonal divisions are not to be found on other instruments.

For although a motet or madrigal requiring all the semitones of the chromatic genus can be played by a skilled and experienced master of the viol da gamba or lute, it cannot be realised as purely and accurately as on a harpsichord such as this. This is the reason: because the frets of viols da gamba and lutes are

P. 66. equidistant from each other (assuming that the higher they go the narrower the stops become) the semitones can and must be called neither major nor minor, but rather mean semitones (INTERMEDIA). In my opinion, every binding, band or fret, refer to it as you wish, contains $4\frac{1}{2}$ commas, as against five commas for the major semitone and only four commas for the minor semitone.

Because both semitones have this discrepancy of a mere half comma on the aforementioned viols and lutes, which on their own sound gentle and calm, the difference between the major and the minor semitone from the same fret cannot be as obvious to the ear as when both parts of the tone are correctly rendered. Nevertheless, by means of manipulation at the frets themselves (off den Bunden helffen), one can make the necessary adjustments. This sort of thing is completely impossible in the cases of harpsichords, with their strings, and organs, to whose pipes no immediate retuning can be made, but must remain as they have been previously tuned.

Accordingly these instruments cannot accommodate the chromatic genus without duplication and division of the keyboard. If anyone wishes to play accurately on the lute, he will have to cut away all the frets, and manipulate the fingerboard without them.

I have been informed by Christopher CORNET, an eminent musician living in Kassel, that he has seen in Italy a similar instrument or spinet to that described above made by an Italian with the name JULIUS CAESAR. This man believes that the only people anywhere to be found who can sing with greater purity and accuracy than these instruments, harpsichords and spinets, are Greek musicians, who have sustained four vocal lines simultaneously (deren derselben zeit vier VOCALES an dem Ort verhandeln gewesen).

Some years ago a fine positive was brought from Italy to the Archduke's court near Graz. All its semitones were split and convenient to use (vollnkomlich zu finden). It ought to be an excellent instrument.

(End of Chapter 40.)

Part IV Chapter 3

INSTRUCTIONS for TUNING the reeds of ORGANS, especially for tuning accurately the REGAL and other instruments, HARPSICHORDS, SPINETS etc., and how to put the whole pipework into good tune.

Pages 148 - 9

Praetorius gives instructions on the tuning of the various sections of the pipework of an organ, initially from a regal.

P. 150. REGAL, HARPSICHORD, HURDY-GURDY and similar instruments. How one can make these instruments harmonious and actually tune them pure.

In this the following must be borne in mind with particular diligence.

1) That one chooses a certain key (clavis) from which to tune, and to which the other keys can always be tuned in accordance with it, one by one.

2) That all perfect octaves and major thirds are tuned completely pure, from the lowest to the highest key, as well as from the highest to the lowest.

3) That all fifths are not exact and pure, but are left beating against one another by a certain amount on the low

P. 151. side. Let it be understood: the higher key is somewhat flattened against the lower note, or stands on the low side: but if one wishes to tune the fifth from below, or the lower against the upper key, the lower must stand and beat too high, that is, somewhat on the sharp side, rather than pure.

Now if these three kinds (of precept) are properly borne in mind one cannot easily make mistakes in tuning: but the last kind concerning the fifths just described is the most difficult to tune or else the most important to be considered. For a complete instrument can be tuned from octaves and fifths, provided that the major thirds are used as checks. Further explanation follows.

Some skilled tuners can also tune from octaves and fourths, and the latter are tuned to beat similarly to the fifths, but in the opposite direction, or vice versa. Then the upper key ought to beat rather too sharp against the lower, but the lower against the upper should beat too flat. The expression "to beat" (schweben) is an organ builders' term and is used by them if any consonant interval does not stand pure. It is such a common term among them, and therefore among many organists, that it is difficult not to accept it. Therefore henceforth, in future I must use it, with regret, and refer to it as high or low. Then the presence of beating is to signify the amount of impurity, tuned either too high or too low. In organs, particularly when one wants to tune the octaves, fifths and fourths, the resonance and sound in the pipe beats and pulses just like the vibrations of a tremulant. The nearer (an interval) is brought to absolute purity, the more the beating gradually subsides, and the pulsations become fewer and fewer until the moment of absolute purity of the octave or other concord. Therefore by means of this beating the dissonance in organs can be observed and recognised more easily and sooner than in regals, harpsichords and similar instruments. Consequently only the octaves which comprise a fifth and a fourth must be and remain absolutely pure. From the fifth, the first part, something is taken, so it necessarily follows that to the fourth, the other part, an equal amount to that taken from the fifth must be given back, if the octave is to remain pure.

The fifth, which consists of a major third and a minor third, as already stated, must not be absolutely pure. However the major third is pure, so it follows that the minor third is impure by the same amount that affects the fifth.

From the major third the minor sixth is obtained by inversion, as if the lower key is placed or taken an octave higher, or the upper an octave lower. Just like the major third, the minor sixth must also be pure.

Thus where one note stands pure against the other, all other keys having the same names must become pure against each other; such as, the C key is pure against the E so it

follows that all keys with the name C, whether lower or
P. 152. upper case letters are used, must be pure against the first and all other E keys. Thus a D is pure against the other and consequently all Ds one against the rest must be pure.

From the above-mentioned minor 3rd there comes, by inversion, the major sixth. In the same way as the minor 3rd is impure and beats, so must the major sixth beat or be impure. This is the position: the minor third is too small, ergo the major sixth must be too big, so that the octave remains exactly pure. Then by inversion, the major sixth beats on the wide side, ergo the minor third beats on the narrow side, for if these two are placed side by side, they must give a pure octave. Unless every section is compensated in this way, the result is that one section must have more than the other. A similar sort of thing happens in the case of pure-standing keys, only with this difference, that the one part will be too high as much as the other part is too small.

On the subject of how one key must stand against the others, it is better and clearer to observe from the following table . Thus:

In	5ths / Minor 3rds	the	higher	key must be tuned against the	lower	++
	4ths / Major 6ths		lower		higher	

++	by an amount as much to	lower / higher	keybeats too high against the	higher / lower	
	as little as the				

The octaves, major thirds and minor sixths, as often mentioned, remain pure.

Now whenever an interval, or rather (vielmehr) a concord, is to remain pure, so the interval and its inversion, both of them, must be the same, either both pure, or both beat, the one too high, the other too low.

If however the one Intermedium is impure and the other is pure, so the correct interval must be false and cannot remain pure. The geometrical principle states: for if to a certain number an uncertain is added, then the whole becomes uncertain. For if to a definite quantity an indefinite quantity is added the whole quantity becomes indefinite, and being given one inconvenience, many follow. (+)

P. 153. Let this be simply stated and outlined. This is about to be indicated, in a form in which the lack or excess of the fifths and fourths, minor thirds and major sixths can be demonstrated correctly.

Now although it is of no great importance, especially to him who finds tuning easy, which key should be the beginning note, it is neverless convenient to start on F, and after that to follow the correct order of consonant intervals, thus:-

The keys at this side will be pure, and those at the other side must always be tuned to these.

1	f		
2	f	c'	
3	f	a	
4	c'	c	
5	c	g	
6	c	e	
7	g	d'	
8	g	b♮	
9	d'	d	
	d	a	check 1
10	d	f♯	
11	a	e'	
	c'	e'	check 2
12	a	c'♯	
13	c'♯	c ♯	
14	c♯	g♯	
	e	g♯	check 3
15	f'	b♭	
	b♭	d'	check 4
16	b♭	e♭	
	e♭	g	check 5
17	e♭	e'♭	

CHOR-TON or correct tone with which the instrument's bearings will be laid (leidenwil); to this f,f' is tuned pure.

CHECKS

If the above octaves and fifths are tuned correctly according to the written description, these five checks must also be right. In check 1, if ever the fifth d against the already tuned a does not beat correctly or stands somewhat false, then all the preceding consonant intervals must be gone over, because either the octaves or fifths are made too pure or too false, until the d and the a reach the required beating. When this check has thus passed the test, it is then admissable to proceed boldly.

Always when one is about to tune step 15 let one take care that from that point onwards to tune the fifths in the opposite way, by tuning the lower against the upper note. If then the lower note makes a perfect fifth with the upper note, it must be brought or tuned to beat on the sharp side. The foregoing table contains the relevant information.

(+) underlining shows translation from the Latin.

After this, one begins the octave descent from the tuned b♭, and tunes the octave B♭ absolutely pure; first, to b♭ the B♭, then to a the A, and so on to the lowest note. Nevertheless take care that these octaves are just and that each one is not in the least sharp to its corresponding note.

P. 154. which has already been tuned pure, for wherever that happens, the fifths, so many of which are still used in the bass, become quite impure, and spoil the best and purest quality of sound if full chords are used.

Now when the descent has been completed, one proceeds to the ascent, and tunes f'♯ to the already tuned f♯, again absolutely pure, g' to g, and so on until the keyboard is completely prepared throughout its compass.

But always, just as earlier with the bass, the greatest care must be taken, the hearing most alert to tune the octaves equally pure, so that both notes of the octave sound as if they were to originate from a single pipe or string, furthermore that throughout the tuning process the major thirds are kept checked and pure. Hence if the f'♯ is made pure with the f♯ then try f'♯ against d' and listen whether this third is completely pure. Also if g' is tuned to g, then try the g' with e'♭: if the a' is tuned with a, then try it with the c♯ and when all this has been thoroughly completed, there is, without the slightest deceit, a pure Harmonia, but it will be achieved only by much practice and usage.

THE SECOND KIND.

1	f	f'		Here everything, including fifths and octaves, that has been mentioned earlier, must still be taken into account.
2	f	c'		
3	c'	g'		Check 1
4	g'	g		This major third f' a' (as indeed all other major thirds) must be absolutely pure. But the third can be heard and discerned much better as a tenth, namely f a', and so can be tuned absolutely pure. But in so doing take care that the fifth d' a' becomes neither too false nor too pure.
5	g	d'		
6	d'	a'		
	f'	a'	check 1	
7	a'	a		
8	a'	e'		
9	e'	b'♮		Checks 2 and 3
	b'♮	g'	check 2	Both of these tests must be applied in the same way as that from f' - a' explained above.
	e'	c'	check 3	

The octaves as well as the thirds must be absolutely pure, the fourths must be rather more than pure, and the fifths beat somewhat in the manner described earlier: now when all the above keys have been tuned, go ahead tuning their octaves, one pure against another, omitting the semitones, to the top and bottom of the complete keyboard. As far as the semitones are concerned, one must first tune the b♭ beating with the f' (which is already pure) just like all the other fifths and then to test and tune the b♭ against the major third d'. As suggested above, this b♭ can be better perceived at the tenth d''. Then the

p. 155. octaves b♭ b'♭ and B♭ : and the fifth e♭ b♭ beating. Then the e♭ must be tested against the tenth g' and made pure. After this the octave e♭ and (blank in original). These three keys c'♯ f'♯ g'♯ should be tuned pure to their thirds a, d' and e' , although, as it is often thought nowadays, these notes are more precisely grasped against their tenths. After this, finally their octaves are tuned.

The fifths C♯ G♯ and F♯ C♯ must be neither too pure nor too impure but must measure slightly greater (etlicher massen), not beating so much as the other fifths, so that when something from foreign keys or among the semitones is struck, it does not jar quite so much.

Although some people think that the fifth C♯ G♯ must be completely pure, I cannot bring myself to agree with them.

Concerning all this the ancients called the interval f g♯ the wolf. Meanwhile these two keys give a very impure minor third, if at times the second mode is transposed down a tone to f, or if something involving musica ficta and chromatic notes should be and must be used. Nevertheless, so that something might be done to help them, and affecting all other keys by a trifling amount, some people have tuned the major third E G♯ not quite pure, but a little wider so that the G♯ comes nearer to the A by a little, and further from the F: and thus almost, but not quite, a minor third, but which can be used as such at a pinch.

Some people will say that the wolf is not F and G♯, but rather that the wolf is between this (G♯) and E♭. Although (G♯)+ and E♭ cannot be pure, this gives a test on all organs. Some are of the opinion that the wolf is between E♭ and F♯ and B♭ and C♯, but I leave to one and all his own opinion. The best thing is to leave the wolf howling in the wood where he belongs, and let him not disturb our harmonious concords.

The reason why F♯, G♯ and C♯ must stand as they do happens on account of the cadences which among others are formed using black notes or semitones, and between F F♯, G G♯, C C♯ there are no diatonic semitones (la fa or mi fa) as there are between A B♭ and D E♭. Consequently B♭ and G♯ among these semitones cannot again be used as in the above cadences. But if the black keys are divided (see Part II no.39) one can please oneself.

But this subject is to be discussed in detail after this from a consideration of the monochord, in a treatise, if God wills, on the basic rules of proportion. For here the desire is solely to establish good practice for organ makers and organists, so that even the simplest could understand something of what has been written here and would have gathered something from it.

+ A blank space in the manuscript or printing. G♯ makes sense.

THE THIRD KIND.

P. 156. Some people give C as the starting note, and say this is musical and basic. Then just like the instruments and organs (this kind is given the name Fuss-ton), they begin most frequently from C, and have the same starting note, not only below but especially from above. Thus it may be best and most suitable to make the start in the middle from the familiar key, whose order is written thus:

1	c'	c	
2	c	g	
3	c	e	
4	g	d'	
5	g	b	
	e	b	check 1
6	e	e'	
	c	e'	check 2
7	d'	d	
8	d	a	
	e'	a	check 3
9	d'	f'♯	
	b	f'♯	check 4
10	f'♯	f♯	
11	f♯	c'♯	
	a	c'♯	check 5
12	c'♯	c♯	
13	c'♯	g♯	
	e	g♯	check 6
14	c'	f	
	a	f	check 7
15	f	f'	
16	f'	b♭	
	d'	b♭	check 8
17	b♭	e♭	
	g	e♭	check 9

NOTE.

From the beginning to No.14 the fifths will be beating on the low side, or sinking, but after that the fifths must be tuned on the high side, for this reason, that the lower note is being tuned against the higher note.

N.B. In all this I have not wanted to ignore the opinion of Calvisius concerning the temperament of instruments. He says: if the concords are to sound right it is certain that they must stand pure in their proportions, neither greater nor smaller.

P. 157.

The same is true of the human voice, trombones and such, to which something can be added or taken away by the human breath. For the human voice guides itself naturally in the right proportions of the intervals, and increases these wherever something is found to be lacking, and takes from them whenever it is found to be too much.

But with instruments, organs, and with harpsichords (Clavier) to a less degree, there is another significance in the light of which some (of the purity) of various concords must be taken to avoid one key suffering all the impurity.

THE KEYS ARE THUS:-

Between	C and D	major tone	$\frac{9}{8}$
	D and E	minor tone	$\frac{10}{9}$
	E and F	major semitone	$\frac{16}{15}$
	F and G	major tone	$\frac{9}{8}$
	G and A	minor tone	$\frac{10}{9}$
	A and B	major tone	$\frac{9}{8}$
	B and C	major semitone	$\frac{16}{15}$

Now if the instruments are to be tuned in these proportions, immediately there would be an imperfect semi-ditone (minor third) between D and F, for it is a minor tone plus semitone, and is short by a whole comma; similarly, there would be a comma lacking in the fifth D to A, which is definitely too much, for the ears cannot tolerate such a deficiency. Therefore keyboards ought to be made available more cheaply, to provide two D s, one a comma distant from the other.

But because this happens in other keys too, it would become too much for the keyboards especially if the duplicated semi-tones were also added. Consequently the temperament must be used, and here it is.

-From the major tone a half comma is taken; to the minor tone a half comma is given. Hence it is evident that nothing is taken from the major third, consisting of a major and a minor tone, and it remains pure. One may see that the alternative part, the minor sixth, the completion of the octave also remains pure. To the major semitone a quarter of a comma is given. Therefore the

P. 158. result is that by now the fourth, consisting of major and minor tones plus a major semitone, is now too big because a quarter comma has been added to the semitone.

Now the fifth has two major tones, a minor tone and a semitone. Because from each major tone a half comma, and thus from both a whole comma, is taken, and against this only three quarters of a comma is given, it follows that the fifths in instruments cannot be complete.

But because a fourth and a fifth make an octave, which is unchangeable, it necessarily follows that if one part becomes greater, the other part becomes smaller, and there's an end to it. Divide an amount into two parts (so that) there are six nummi[+] on each side. If now to the one side you give seven nummi, it is necessary that the other part should have only five nummi if the sum is to remain whole, getting neither smaller nor bigger.

But if the organ makers say that the fourth D G beats, the minor third G B♭ also beats. Therefore the minor sixth D B♭ is pure etc. That is indeed correct to some extent, but not so according to the second art and demonstration. (Das ist wol etwas nach ihrer Art aber nicht recht secundum ortem & demonstrationem geredet) but if I wish to show that the minor sixth is pure, I must put it this way:

The major third and the minor sixth constitute the octave. But the major third in the temperament retains its true proportion, therefore it is necessary that the minor sixth retains (its true proportion). This must be

[+] nummus - a Roman coin.

so. Hence a fifth and a fourth constitute a dupla or octave, and the fifth in the temperament is made smaller by a quarter of a comma, therefore it is necessary that the fourth, which is joined to it is increased by a quarter of a comma. On the other side, so with the others, for it is necessary that judgements about the parts should be made from the whole.

N.B. The symbol which Praetorius used in all three tuning schemes for E♭ is actually D♯. The method in each case depends on the note being E♭, and that is the reason why I have used E♭ in the translation, to avoid confusion.

(End of Chapter 3.)

Andreas Werckmeister: ERWEITERTE und VERBESSERTE ORGELPROBE.

Second Edition, (Quedlinburg 1698, reprinted Kassel 1970.)

(The section on temperament begins on p. 78.)

Line 21 It is not necessary to write about temperament here particularly, especially since the inclined reader will find in our treatise, which deals with temperament essentially, and in the accompanying monochord, a comprehensive and detailed account.

There are to be found a few evil-minded folk who perhaps do not understand our instructions and ideas, or out of hate do not wish to understand. Those people who say that they want the temperaments of the ancients or of Praetorius to remain without change have therefore begun to sow the seeds of doubt. I can easily put up with this, for
p.79 I consider myself much too insignificant to want to lay down the law on this subject. They can, however, recognise partially that the music of Praetorius's time, now removed by nearly a century, has not been created in the same way as the music of today, since there are many transpositions using chromatic notes (transpositiones ficta) with regard to which the revered Praetorius served his generation well, and with such a temperament they can be pleased with the way in which it proves adequate for his compositions. Where necessary he has been able to put a sub-semitonal interval with the note D♯, and that was all that was needed. Nowadays, however, since one needs as it were to use the whole keyboard in a circular fashion, it is impossible to make do with such a keyboard. Since now by God's grace music is so much more advanced (gestiegen) and changed, it would be absurd not to consider improving the keyboard, so that to some extent such of today's pieces as are well composed would not be spoilt, and cause an uproar. Now those people who want to stick to the old temperament would of necessity have to reject most of the indeed noble transpositions now in use, which would be very reckless, and would end in causing the scorn of the best of the composers

and musicians of the day. Consequently it is of prime importance, especially to an organist, for him to take pains to acquire a good and adequate temperament, for if an organ, however splendid and expensive, were not well-tempered but patched and botched with lots of sub-semitonal intervals, there would be little satisfaction or pleasure to be had from it. Now he who understands little other than the common temperament might even tune the D♯ (+)
p.80 a little flatter so that the fifth G♯ and D♯, and likewise the third F♯ and D♯ might not sound so horrible, for the D♯ and G will become tolerable by this time, and our temperaments are not really so very far removed from those of the ancients as some people do indeed think.

Zarlino believed that if all fifths beat at $\frac{2}{7}$ comma flat the result was none other than a good temperament. That is not the case if all fifths beat at $\frac{1}{7}$ comma, making the last fifth, which is F - c, if one begins at c, different, and is $\frac{4}{7}$ comma too big, and all too hard on the ear. The third is $\frac{3}{7}$ too big. At the same time:

C♯ - F $\frac{3}{7}$	(too big)	F - A $\frac{8}{7}$	A - C♯ $\frac{3}{7}$
D - F♯ $\frac{3}{7}$		F♯ - B♭ $\frac{3}{7}$	
D♯ - G $\frac{8}{7}$		G - B $\frac{3}{7}$	B - D♯ $\frac{3}{7}$
E -- G♯ $\frac{3}{7}$		G♯- C $\frac{8}{7}$	

If now the major thirds at $\frac{3}{7}$ could be tolerated, it is of little value that the thirds D♯ - G, F - A, G♯ - C, should be allowed to beat at $\frac{8}{7}$ comma. Particularly with F - A, D♯ - G, it is difficult to alter these so that all consonances have equal amounts of beating. Nor is it advisable, for, because the thirds in the diatonic genus are more frequently needed, and, whereas not one simple organist in a hundred even knows how he ought to make use of modes starting on C♯, F♯, G♯ etc., one much prefers to put the pleasanter temperament into the most frequently used thirds.

It is best to stand by what Boethius and other much experienced old musicians have said, namely, that musical

---

(+) i.e. the raised key D♯/E♭.

harmony is discordant concord (discors concordia), and as in the whole of nature, one day less warm or less cold than other days, so this temperament must undergo change. Moreover, the aforesaid Zarlino treats of three kinds of temperament. First in Istitutione armoniche, next in Dialogis, (+) and then in Sopplimenti musicali, so that every kind is given simple coverage.

p.81 Also somebody might challenge me in my Temperatur, that I could allow the foreign thirds; C♯ - F, E♯ - B♭, G♯ - C, to be almost a comma too wide, since Zarlino altered the scale and made the major thirds pure. My answer is that, rather than rejecting the diatonic scale, Zarlino wanted merely to show how the major and minor thirds can be given definite harmonic proportions, which were nearer equality than they were before. Now although the proportions of the thirds according to the ancients make major thirds a comma bigger than equality, minor thirds a comma smaller than equality, they have been accepted by the ear not so much as dissonances but as consonances. How Faber Stapulensis, Glareanus and others agree with this is to be seen in Baryphonus Pleiades musicae I, question VI. At this particular reference, we also find the reason why Bartholeme Ramos and Zarlino discovered the syntonic scale and why it has not happened that such a scale is used in harmonic mutation, for the fifth D - A measures a comma too small, A - D a comma too big, which in harmony cannot be tolerated. Likewise , F and A is a comma too big according to the ancients, like the other major thirds etc. Therefore it is a poor expedient to reproach Zarlino with changing the scales on this account, because before that time thirds had been a comma $\frac{81}{80}$ too small or too big. For someone to turn it either this way or that way, the result can be

---

(+) This reference, I think, is to a work of Zarlino's pupil.
V.Galilei: Dialogo della musica antica et della moderna, Florence, 1581.

and must be a temperament. Now if the thirds which the ancients declared a comma too big or too small still sound acceptable to the ear, one will surely be happy if only in some of the thirds, those indeed which are needed only very rarely, the comma too much or too little occurs. If someone still wants to make three or more sub-semitonal intervals on a keyboard, according to taste, it will be nothing but a botched and patchy job, and the other intervals must become tempered accordingly. To me it is on a par with someone saying that the Holy Scriptures were not complete without a gloss to hand. Sed glossa speciosa fefellit. (But specious glosses have deceived.) Sub-semitonal intervals have deceived many, and even if there were a hundred to the octave, they would not meet requirements. Natura ab infinitis abhorret. (Nature abhors no restriction). Much less so if only about three of them are put into a keyboard.

Someone else may consider it (temperament) as much as I have done, but to inform without fame, he will see for himself what there is to do. One person will also warn against composing in all keys, on account of C♯, F♯, G♯, but I say, if one person does not do it, the other one will, and so indeed would have composed in these very keys equally. But the progressions so run, that sub-semitonal intervals are not adequate. And who am I to dictate certain bounds to this man or that man, in that I want to forbid him to compose in this key because the sub-semitonal intervals would not be adequate.

The free arts want to have intellects (ingenia) also free. One cannot constrict and set certain boundaries, for in whatever is suitable and right to the course of nature every man ought to exercise his freedom.

With this let us finish; that God grant that all our work may redound to His glory, and to the service and use of one's neighbour, so that we may uphold before God and our neighbours a pure and good conscience to our life's end.

Wolfgang Caspar Printz: SING= und KLING=KUNST.

(Dresden, 1690, reprinted Graz, 1964.)

(Extracts concerning eminent theoreticians of the period.)

From Chapter 11.

Para. 6 About the year of our Lord 1522, according to Petrus Opmeer, Jacobus Faber Stapulensis in Paris devoted himself again to the particular study of the philosophy. Elementa Musicalia is also to be found among his writings, for he was an outstanding musical theoretician. But he was not yet prepared to include thirds and sixths among the concords because of the excess of a comma (wegen des Excesses eines Commatis), since at the same time their true proportions had not been discovered (erfunden). Regarding the minor third or 'semi-ditone', Sethus Calvisius writing in the introduction to his Melopoeiae has this to say: "The semi-ditone falls on the ear quite acceptably and pleasantly, but it is still not taken as a concordant interval". And a little later he says this about the major third or ditone: "The ditone, placed between the sesquitertia and the sesquiquarta in no way makes their sounding together complete. (macht die Zusammenstimmung keines weges vollkommen). Now because he believed that neither the ditone nor the semi-ditone were consonant intervals, he had much less justification for accepting the two sixths as concordant as long as they were formed from the ditone and the semi-ditone added to the fourth. Nothing concordant can originate from a bad dissonance if one inverts the interval, that is, reverses it within the octave.

Para. 14 In the year 1547, Heinrich Glareanus, a capable man, after his instruction by Franchinus Gafurius, published the twelve modes and presented and proved these with basic reasoning in his Dodecachordon. He had been the first among the theoretical musicians to reckon the thirds and sixths among the consonant intervals, although he still used the old diatonic genus, in which he followed his hearing rather than the verdict of the intellect. Since, according to the

intellect it was quite impossible to accept them as consonant intervals, because they possessed very awkward proportions and thus were unpleasant to the ear. Solely because the practical musicians gave to them, although unknowingly, the right proportions and consequently roused in the hearing a gracefulness, did Glareanus give them his approval, irrespective of his ignorance of the real reason.

Para. 15. Shortly afterwards, actually in the year of our Lord 1550, Josephus Zarlinus Clodiensis, an Italian, Kapellmeister of the Doge of Venice, and a very famous man, excellent equally in the art and theory of music, discovered the true and right proportions of the so-called imperfect consonances.

It will be worth the trouble to explain a little how he discovered these new and correct proportions and also the syntonic scale. The old Pythagorean musicians had not had those very concordant intervals, usually called the imperfect consonances. But because in Zarlino's time, and indeed for a long time before that, these consonances were used by the practical musicians, and because he discovered by means of the monochord divided in the old way that they did not rightly conform and make good harmony, he resolved to use the rules of inveniendo medio harmonico, that he might find thereby the true proportions of the said consonances. Therefore he set off by dividing the octave into the fifth and the fourth, in the ratio 6 - 4 - 3. Then he found the division into five parts, and from it recognised that from it was derived the sesquiquarta (major 3rd) and sesquiquinta (minor 3rd) in the ratio 15 - 12 - 10. He applied these numbers to the monochord and consequently found that they sounded very pleasantly in super-particular proportion. Furthermore when he saw that the sesquiquarta could not be provided from two (major) tones, he found it necessary again to divide these harmonies. This being done, he found that they consisted of the sesquioctave and sesquinona thus making the major tone and minor tone. Through the subtraction at last he recognised the small intervals. For after he subtracted the sesquiquarta or major third from the sesquitertia or fourth., there remained the sesquidecima quinta,

the proportion of the major semitone; and after he subtracted the sesquiquinta or minor third from the sesquiquarta or major third there remained the sesquivigesima quarta, the proportions of the minor semitone.

Para. 38 In this century it seems to me Thomas Fregius lived, whose writings the unfortunate fire of Sorau snatched from me, so that I cannot be certain, at what time he made them public. But under other and much better synopses he has written about the voice (vox affectionibus) and the tetrachord in a succinct treatise. However he did not know the new Zarlino Proportions, but still adhered to the old Pythagorean music.

From Chapter 12.

Para. 46 During this century Johannes Battista Doni, a noble musician became famous. He wrote a little book called <u>De generibus et modi</u>. In it he describes a threefold keyboard for the presentation of the three genera, of modulation, and of changing the tones (zur Veränderung der <u>Tonarum</u>).

Not very long before Kircher published his <u>Musurgia</u>, Nicolaus Ramarinus discovered a sort of harpsichord which has an ordinary keyboard but can be varied in every interval; accordingly he divides each tone into nine commas, and arranged so many stops thereby, by means of which the sound can be altered immediately to the required comma. The first stop is set for Roman music and is called the usual Tonus chorista, or Chor=ton. So now as required either by voice or transposition of the song this instrument can immediately be raised or lowered. For example if the Chor=ton ought to be raised by a semitone, one pulls the required stop, and the whole keyboard immediately is raised a semitone. (From Kircher)

Para. 74 Abdius Treu, Professor of Physics and Mathematics, Altorff, was my former tutor, revered among students and eminent mathematicians. Thus it is fair to count him among the most famous music theoreticians. For he has been the first discoverer of the most accurate of all Temperaments, which I have described in Part III of my Phrynidis and has given musical lectures which have since been printed.

Para. 76 In the year 1664 P.Theodorus Moretus, S.J. ... professor at Breslau, published and printed Propositiones Mathematicas ex Harmonica de soni Magnitudine. But from these it appears that he was still a Pythagorean and devoted to the old music.

Appendix 2. TEMPLETS.

Templet construction is explained in Chapter 9. This appendix contains all the templets of the works of Froberger which are analysed in Chapter 10. The templets are arranged in alphabetical order. All templets are also stored in data file form on cassette tape. The names by which works or sections of works are identified for data file purposes are to be found at the appropriate places on the templets. A data-file name consists of a mixture of capital letters and figures, e.g. FROR1C2B.

Appendix 3.

A USER-MANUAL FOR TEMPERAMENT ASSESSMENT PROGRAMS.

The method of temperament assessment explained in Chapter 9 faces the problem of execution. Although the calculations involve only simple arithmetic. they are so numerous, so time consuming, and so dependent upon the accuracy of the person making them, that the task of working out the results of even a short templet, run in a single temperament, is scarcely feasible. The results from long templets, run in several temperaments, are necessary for the method to have useful application. Computerisation provides the only solution.

Alastair D.Pollard [+] was commissioned to devise methods whereby
1) the data of a templet could be recorded, and
2) any temperament defined by twelve cent-values could be applied and results obtained. He wrote three computer programs to do the work required.

A. TEMPLET5. A program which fulfils two purposes:
   1) To create a data file of templet information, or
   2) To alter the content of an existing data file.

B. IMPURITY. A program to apply any given temperament to the data file of a templet, and to calculate absonances, absonance levels and arpages.

C. ABSONANCE. A program similar in purpose to IMPURITY, but which can accommodate changes of duration unit, metre and speed within a succession of related data files.

EQUIPMENT USED:

a)	Microcomputer:	BBC, model B 32K.
b)	Cassette recorder:	BBC, Microcomputer system.
c)	Video:	Triumph, 14 in. television b & w.
d)	Dot Matrix Printer:	Epson RX-80.

The programs are retained for use on cassette tape.

[+] A.D.Pollard B.Sc. hons., computer studies, St. Andrews, is also an active musician: singer, violinist, Old Chorister of Durham Cathedral.

fr.1 fr.2 etc.

A1) TEMPLET5 USED TO CREATE A DATA FILE OF TEMPLET INFORMATION.

Ref. Reference numbers apply to both sides of the double page.

Procedure: Load the computer with the taped program "TEMPLET5" As soon as this is done the computer displays the 'ready' sign >_ The operator types RUN ⟨RETURN⟩ . The ⟨RETURN⟩ key is depressed after each line of information has been completed. One by one the headings opposite appear on the screen, each requiring a response from the operator.

1) A new file is to be made, and so the operator does not type anything, but presses ⟨RETURN⟩ for the next line to appear.

2) Here is an example templet of independent frames, each showing a different arrangement. This is to be typed into the computer in a coded format to make a data file.

3) The operator enters the number of the first frame of the templet, which may not be 1.

4) The operator enters the code name of the new data file of the templet. The name entered here is FRORICIA, an abbreviation and compression of Froberger, ricercar 1, section A.

5) The screen displays the order of input of data for each frame:-

6) DURATION. At the prompt Dur? the duration of the frame is entered. This may be a whole number, or decimalised. This is followed immediately by a comma to separate it from NOTES.

7) NOTES. The computer requires eight symbols to represent, or account for, the four voices of the templet. Letters A to G are used in the usual way. The red keys of the BBC keyboard f0,f1,f2,f3,f4, control the symbols n,♯,♭,x,k, respectively. (n = natural, x = double ♯, k = double ♭ .) To account for a missing note (a minim rest in the example templet), red key f5 is used, which enters the double symbol -- . The notes or note omissions are entered in descending order of voice S, A, T, B. A solo melody note, irrespective of the part it represents, is entered as if the melody note and its tonic were S and A respectively, respectively, and T and B were silent. (See fr.5.) Immediately after entering the chord, the operator enters a comma to separate NOTES from INTERVALS.

9)

```

Mel.					996	

fr.1 fr.2

Ref.

8) <u>INTERVALS.</u> The computer requires six intervals, represented by the six interval boxes of the templet, and not including the melody box, which is an occasional box, and has its own routine. (See 7) above.) The intervals are entered in templet order from the top, each separated by a comma. The final interval requires no comma after it, but ⟨RETURN⟩ registers the complete frame and anticipates NEXT FRAME. Empty interval boxes in the templet, which denote absence of any particular interval, are entered solely as the commas which separate the interval boxes.
An empty T - S box merely requires ⟨RETURN⟩ .
An octave is entered as o.
A duplicate is entered as - (minus sign).
A frame of complete silence is entered :

Dur?,-- -- -- -- ,,,,, ⟨RETURN⟩

9) This shows the complete templet, displayed on the screen, exactly as typed by the operator. It is possible to enter a maximum of 350 frames per templet. If the maximum is reached, a warning message, FRAMES FULL is displayed.

10) During the making of a data file, a mistake may be made in an entry which the computer rejects. Several checks are made by the program to validate each frame after it is entered. The prompt NEXT FRAME does not appear until the correct number of pieces of information has been entered. The duration and content of the chord are also validated. Three examples of these checks are shown here.

11) When the final frame of the templet has been entered, a duration of 999 is entered to signify the end of the templet. The duration 999 is essential, but the rest of the frame is not validated, although the correct sequence of events should be observed.

The templet has been entered. It is now possible to check and change the information entered.

12) The screen displays the first frame of the data file in this slightly different format. There is also a change of symbols:

- (duplicate) is displayed - l ;
an empty interval box is displayed space .

13)

COMMAND >>> P

14)

1	BbEnGnC#	610	884	610	316	925	316
2	Bb____Fn	space	space	space	space	498	space

2.5	BnD#F#Bn	814	884	702	dupl.	0	dupl.
0.5	AnBn____	996	space	space	space	space	space

15)

COMMAND >>> Q

RECORD then RETURN

Ref.

13) The computer asks for a command. At this point all the amenities for changing and editing the program are available, and ready to be used. If the operator knows of any mistakes or omissions made during the typing, he/she can put them right immediately. The method will be fully dealt with in the section of the manual A2). A useful check at this point is to ascertain that the data file contains the same number of frames as its templet. (See section A2) .)

14) When the operator is satisfied that the data file in its provisional and pre-edited state is complete, the key P may be depressed to print out the provisional templet on an attached printer. A blank line occurs after every ten frames, to make the output easy to read.

Note: A duplicated interval is displayed in three ways:
in the handwritten templet by - ;
in the screen display by -1 ;
and in the printed templet by dupl. .

15) To preserve the data file on tape, depress Q and record in the usual way.

TEMPLET5

To alter the contents.

```
16) Enter FILE to be altered OR nothing for a NEW file
    FILE?FRORIC9A
17) NUMBER OF FIRST FRAME?1
    POSITION TAPE AT START OF DATA
```

A2) TEMPLET5 USED TO ALTER THE CONTENTS OF AN EXISTING DATA FILE.

Ref. The modification of a provisional or existing data file may entail adding frames, deleting frames, or changing a frame's content. Obviously a data file must be correct to the last detail, and mistakes can occur at any stage between actual musical score and completion of data file. Most mistakes are discovered and rectified shortly after being made, but a few mistakes may persist and lie undetected until the stage where one of the temperament programs is applied. Much laborious checking is avoided if the operator, using "IMPURITY", runs a provisional data file in a familiar temperament. The print-out from this immediately reveals discrepancies in notes, intervals and typing. These result in sore-thumb and outrageous absonance levels. Discrepancies in duration are revealed in the final results at the end of the print-out. The templet and provisional data file print-out can then be scrutinised, and mistakes noted. The operator is then ready to edit the provisional, and make a permanent or definitive, data file.

(A minimum of routine instructions, already used in A1), is repeated here.)

Procedure:- Load the computer with the taped program "TEMPLET5" .

16) The operator enters the name of the data file to be altered.

17) The operator enters the number of the first frame. This is the only opportunity of changing this number.

The operator feeds the data file into the computer. The time this takes depends on the length of the file. When this operation is complete the tape stops, and the first frame of the data file is displayed on the screen. The data file is now ready to be edited.

18) COMMAND >>> A

19) ADD A FRAME AFTER CURRENT ONE
Dur?.5,BbFnFnDn,498,0,316,-,814,-

20) 0.5 BbFnFnDn 498 0 316 -1 814 -1

COMMAND >>> D

21) DELETE. Y OR N Y

22) FRAME DELETED

2 AnFnFnDn 386 0 316 -1 702 -1

COMMAND >>> N

23) FRAME NUMBER?1

1 BbEnGnC# 610 684 610 316 925 316

COMMAND >>> E

24) CHANGE CURRENT FRAME
Dur?1,Bb__EnCn,,,386,,996,610

25) 1 Bb EnCn space space 386 space 996 610

Ref.

18) The computer asks for a command. After the completion of every command, except Q (see below), the computer asks for a further command. The available commands are as follows:-

+ to display next frame

- to display previous frame.

* to display current frame + 10.

£ to display current frame - 10.

A to add a new frame after current frame.

D to delete current frame.

N to display frame number.

E to change current frame.

P to print the data file on the printer.

Q to record the amended data file.

* The screen displays the frame ten frames beyond the current frame

£ The screen displays the frame ten frames before the current frame.

19) A This command enables the operator to extend the data file at any desired place by adding a new frame. Enter the new frame in the same way as shown in A6), A7), A8).

20) When RETURN is depressed to register the new frame, this is redisplayed in the format in which it is stored in the data file.

21) D The command to delete the current frame needs confirmation before being executed. The operator must type Y or N (Yes or No).

22) If Y, the frame is deleted, and the screen displays the next frame. If N, the current frame remains.

23) N When key N is depressed in answer to a COMMAND⟩⟩⟩ (as opposed to N in 22) above), the computer asks for a frame number: e.g. N75 recalls frame 75 to the screen, and N75 becomes the current frame.

24) E This command enables the operator to change the contents of the current frame.

25) When ⟨RETURN⟩ is depressed, the amended current frame is displayed in its storage format.

26)

COMMAND >>> Q
RECORD then RETURN

Ref.

Depending on the length of the data file, the operator may have to wait a few seconds, during which time the computer executes the command. As soon as the computer displays the current frame, followed by COMMAND⟩⟩⟩ the computer is ready to carry on.

P The penultimate command. When all amendments have been completed, P is depressed to print the definitive data file. Before this however, the operator should check that the number of frames in the data file tallies with the number of frames in the templet. It can be done thus :-

a) Press N and the number for the first frame of the data file. The first frame of the templet should be displayed.

b) Press - to display previous frame. The same frame should be displayed again. If so, the templet and data file tally at the start.

c) Press N and the number for the final frame of the data file. The final frame of the templet should be displayed.

d) Press + to display the next frame. The same frame should be displayed again. If so, the templet and data file tally at the end also.

26) Q The ultimate command. To preserve the definitive data file, Q is depressed, and the data file is recorded in the usual way. Q marks the end of the run of the program.

IMPURITY

1) NAME OF TEMPERAMENT?ONE FIFTH COMMA MEANTONE, Eb - G#
ENTER 12 CENT VALUES TO DEFINE THIS TEMPERAMENT
2) ?0,84,195,307,391,502,586,698,781,893,1005,1088

8) DATAFILE :- STARTING AT FRAME
NAME OF TEMPERAMENT :-

IMPURITY COUNT =
DURATION =
ARPAGE =

9) TOTAL IMPURITY SO FAR =
TOTAL DURATION SO FAR =
TOTAL ARPAGE SO FAR =

B) IMPURITY Ref. This program calculates the absonances, dissonance levels, impurity count and arpage of a data file when run in any given temperament.

The operator loads "IMPURITY" into the computer.

The operator types RUN ⟨RETURN⟩

Stage ONE Information required.

1) The computer asks for the name of the temperament to be used, which the operator enters.

2) The operator enters the twelve cent-values which define the temperament, separated by commas. After the twelfth cent-value ⟨RETURN⟩ is depressed.

3) The operator enters the name of the data file.

4) The operator enters the total duration of previous data files in the series, otherwise enters ø .

5) The operator enters the total impurity count of previous data files in the series, otherwise enters ø .

6) The operator selects the appropriate data file.

Stage TWO The Calculation.

The operator starts the tape. The computer accepts the data file in blocks, stopping and restarting the tape, as it requires. It displays and prints blocks of five or six frames, then stops to receive the next block.

7) This shows the format of the print-out: absonances across the page with the frame's absonance level at the far right.

8) At the end of the run of numbered frames, the results of the calculations of the data file are printed under appropriate headings.

9) If the data file is one of a series, running totals are supplied, incorporating numbers 4) and 5) above.

ABSONANCE

1) NAME OF TEMPERAMENT?QUARTER COMMA MEANTONE, Eb - G#
2) ENTER 12 CENT VALUES TO DEFINE THIS TEMPERAMENT
?0,76,193,310,386,503,

TIMING?2
11) PUT TAPE TO START OF DATAFILE

FRAME	A - S	T - A	B - T	B - A	B - S	T - S	TOTAL

12)

C) ABSONANCE This program extends the scope of IMPURITY, so that a single arpage can be obtained for an extended work which involves temporal change, provided that all sections can be related to a standard pulse.

Ref. ↓

At least one section of the work, probably the first main section, contains the standard duration unit and number of units per bar.

Stage ONE Information required.

1) to 5) These correspond exactly to 1) to 5) of IMPURITY.

6) The operator enters the code (1, 2, 3 or 4) of the duration unit of the templet, in this case 2 for crotchet.

7) The operator enters the number of units per bar, in this case 6.

8) The operator enters the code of the standard unit.

9) The operator enters the number of units per standard bar.

10) The operator enters a code for the relationship between a bar of the templet and the standard bar. In this case a bar of the templet (6 crotchets) equals a standard bar (4 standard crotchets).

11) The operator selects the appropriate data file.

12)

IMPURITY COUNT = 2724.25
DURATION = 180
ARPAGE = 15.1347222

Stage TWO The Calculation.

Ref.

12) The process, apart from the final results, is exactly the same as IMPURITY.

13) NORMAL. The standard section. The results printed are completely independent of any other section, and precisely the same as for IMPURITY 8).

14) The computer announces the temporal relationship between this section and the standard section.

15) DURATION STANDARDISED. The computer gives amended results for this section, in this case reduced by one third.

16) RUNNING TOTALS. The impurity count and duration of 15) are added to previous running totals, and a new overall arpage given.

Conclusion The Testing of the Programs.

Test templets of ten to twenty frames were specially written to test all aspects of the computer work:

Four, three, two note frames, melody frames.
Frames with notes omitted in various parts.
Frames of total silence.
Consecutive templets in different metres and with different duration units.

The calculations which eventually the computer would work out were laboriously worked out by conventional arithmetic means, assisted by a pocket calculator.

The test templets were put on data files and tested using IMPURITY and ABSONANCE , as appropriate.

When all computer programming was complete, and all computer results tallied with results obtained by conventional calculation, the programs were accepted as suitable for the work they had to do.

Computerisation could then proceed with confidence.

Addendum to Appendix 3:

The following program, written in BBC BASIC, calculates the specification of any meantone temperament. The only information required is the fraction of the comma, and the number of fifths on the sharp side of the circle. All the regular meantone temperaments specififed in the text were calculated using this program.

360 END
```

Here, for example, are the printed results of a three elevenths meantone temperament, very similar to Zarlino's two sevenths meantone temperament.

```
Give the size of comma fraction thus :
NUMERATOR ?3
DENOMINATOR ?11
SIZE OF TEMPERED FIFTH = 696.089727

-------------------------------------------------
How many sharp fifths are needed ?8
SHARP SIDE FIFTHS
C     0
G     696.089727
D     192.179454
A     888.269181
E     384.358909
B     1080.44864
F#    576.538363
C#    72.6280904
G#    768.717817

FLAT SIDE FIFTHS
C     0
F     503.910273
Bb    1007.82055
Eb    311.730819
```

Here are these figures, correct to the nearest cent, in the format used in the text.
