

**Long-term Changes in Land Cover and Carbon Storage in
Tanzania, East Africa**

Simon Willcock

Submitted in accordance with the requirements for the degree of
Doctor of Philosophy

The University of Leeds
School of Geography

August 2012

The candidate confirms that the work submitted is his/her own and that appropriate credit has been given where reference has been made to the work of others.

This copy has been supplied on the understanding that it is copyright material and that no quotation from the thesis may be published without proper acknowledgement.

The right of Simon Willcock to be identified as Author of this work has been asserted by him in accordance with the Copyright, Designs and Patents Act 1988.

Acknowledgements

I thank my supervisors, Dr Simon Lewis, Prof Oliver Phillips, Prof Pantaleon Munishi and Prof Jon Lovett for introducing me to the study of tropical forest ecology; for the opportunity to work with both the AFRITRON and RAINFOR consortiums; and for their advice, help and encouragement. I acknowledge financial support from the Leverhulme Trust and the Stokenchurch Charity.

This project would have been impossible without the friendship and assistance of all the members of the Valuing the Arc project. In particular, I am very grateful to Prof Andrew Balmford, Prof Neil Burgess, Dr Philip Platts, Dr Ruth Swetnam, Dr Antje Ahrends, Dr Andrew Marshall, Dr Rob Marchant, Dr Marion Pfeifer, Dr Brendan Fisher, Dr Marije Schaafsma, and Dr Julian Bayliss.

In Tanzania, I thank the Tanzania Commission for Science and Technology (COSTECH), the Tanzania Wildlife Research Institute (TAWIRI), the Sokoine University of Agriculture (SUA), and WWF-Tanzania for permission and support given whilst the research was undertaken. In addition, I thank the many foresters, biologists and volunteers who assisted with the collection of the unpublished data utilised in this study; including Nike Doggart, Kathryn Doody, Eibleis Fanning, Alex Lowassary, Boniface Mbilinyi, Nisha Owen, Deo Shirima, and Elmer Topp-Jorgensen. Asante sana.

Many people have offered assistance and advice during my PhD; my thanks go to Nikée Groot, Carol White, Stephanie Organ, Kate Staines, Sophie Fauset, Keith Bloomfield, Michelle Johnson, Pengfei Li, Gemma Dooling, Dr Ian Lawson, Dr Tim Baker, Prof Emanuel Gloor, and the Ecology and Global Change cluster. I would also like to thank the support staff within the School of Geography; in particular, Calum Carson, Dominic Emery, Samantha Bowman and Jacqui Manton.

I would like to thank my parents, my brother, my sister, and Jessica Weyell for their never-ending support and understanding throughout the PhD process.

I dedicate this thesis to the memory of Amani Mahundu (a superb field assistant and a better friend), Laura Harpin, Patrick Rolfe, and Freya Willcock. You will all remain in my thoughts.

Abstract

The carbon stored in vegetation varies spatially and temporally due to a complex mix of anthropogenic, climatic and edaphic variables. Thus, the success of climate change policy developments such as REDD+ (Reducing Emissions from Deforestation and Forest Degradation) relies heavily on measuring and understanding this variation in the past, present and future. Here, I first analyse the change in forest cover within a 33.9 million hectare tropical study area in eastern Tanzania. I develop both linear and non-linear baselines of deforestation, providing evidence that Tanzanian forest policy has resulted in forest transition. I then present an Intergovernmental Panel on Climate Change (IPCC) ‘Tier 2’ reporting-compliant look-up method to estimate regional carbon storage, and associated 95% confidence intervals (CI). Applying this method to my study area indicates that 1.58 (95% CI: 1.56-1.60) Pg of aboveground live carbon (ALC) is stored across the landscape in the year 2000. Combining these Tier 2-type values with the historical land use/cover data I derived, I estimate that my study area shows a total committed carbon release of 0.94 (0.37-1.50) Pg C between 1908 and 2000. However, look-up methods are overly simplistic for heterogeneous landscapes. Using regression equations, including the effects of disturbance, my IPCC ‘Tier 3’ compliant estimate for the same region in the year 2000 is 1.32 (0.89-3.16) Pg ALC. The most influential variables of carbon storage in the region are human, the strongest impact variables being the nature of the local governance regime (land under national control contained only 40-65% of the ALC stored in areas under local control) and historical logging (areas that had previously experienced logging held 51-77% of the ALC of never-logged areas). Throughout, I provide spatially explicit estimates to aid decision-makers who, due to the influence of anthropogenic variables, could significantly affect landscape carbon storage across this important area.

Historical logging	An attempt to record for each forest reserve an indication of the past logging history. Areas were assigned one of four categories: no logging, partially logged, clear felled and no data	0.1km	[9]				
Governance	The governance of the land. Land categories were divided into those under national control, local control, joint management and unknown.	Various	[10]				
Mean annual temperature	The mean annual temperature derived from the mean monthly temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset	0.1km	[11, 12]	C I i m a	Temperatures increases and extreme droughts will decrease forest productivity, and therefore carbon	WSG will increase with increased levels of drought. Other climatic factors may also be important.	Changes in climate will alter species composition. Increasing amounts of precipitation and an

Mean annual maximum monthly temperature	The mean annual maximum temperature derived from the mean monthly maximum temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset			t i c	storage and sequestration. However, carbon storage may increase with increased levels of gradual drought. [3, 13-16]	[14, 16, 17]	increasing temperature range will result in increasing stem density. [8, 16, 18, 19]
Mean annual minimum monthly temperature	The mean annual minimum temperature derived from the mean monthly minimum temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset						
Mean annual monthly temperature range	The difference between the mean annual maximum and minimum temperatures						
Mean maximum cumulative water deficit	Maximum mean cumulative water deficit (calculated as [15])	4km	[20, 21]				
Mean number of dry months annually	The average number of months annually that precipitation is exceeded by potential evapotranspiration	0.2km	[22]				
Wind speed	The mean annual wind speed 50m above the ground						
Total nitrogen content of the soil	The amount of organic carbon present in the soil to a depth of 1m			E d a p h i c			
Total carbon content of the soil	The amount of nitrogen present in the soil to a depth of 1m						
Percentage sand content of the soil	The mean percentage mass of sand in the soil to a depth of 1m						
Total available water capacity of the soil	The available water capacity of the soil to a depth of 1m	10km	[23, 24]		More fertile areas will show greater growth rates and increased levels of carbon storage. [3, 16]	More fertile areas will show lower WSG values. [16]	As soil fertility increases, stem density will increase. There will also be more large stems. [8, 16, 19]
pH of the soil	The mean pH of the soil to a depth of 1m						
Soil fertility	A mean measure of soil fertility to a 1m depth. Calculated as ((100-Aluminium saturation)/100)*effective cation exchange capacity						
Mean burned area probability in the fourth quarter	The mean burnt area probability from January to March			F i r e	Areas that experience burns more frequently will show lower carbon storage levels. Overall, they will show lower rates of growth, but during recovery from a burn, growth rates may be increased.		
Mean burned area probability in the third quarter	The mean burnt area probability from April to June						
Mean burned area probability in the second quarter	The mean burnt area probability from July to September						
Mean burned area probability in the first quarter	The mean burnt area probability from October to December	0.5km	[25]			Areas that experience burns more frequently will show lower WSG values. [26]	An increased probability of fire will result in a decreasing stem density. [26-28]
Annual mean burned area probability	The annual mean burned area probability						

				[26, 27]		
Aspect	The aspect of the slope	0.1km	[12]	G e o g r a p h i c		
Mean annual global horizontal solar radiation	The mean annual global horizontal solar radiation at ground level	40km	[30, 31]		Higher solar radiation results in high levels of growth and carbon storage. [19, 29]	Light demanding pioneers show lower wood density. [7]
Spatial autocorrelation term 1	Latitude + Longitude + Latitude*Latitude + Longitude*Longitude + Longitude*Latitude	0.1km	N/A	S p a t i a l	None - included in the model to help account for landscape scale spatial autocorrelation. App. 3.3 Ratios used in the derivation of understudied carbon pools

Vegetation Group	Unmeasured vegetation types (%)	Vegetation biomass below the DBH threshold ¹	Litter	Coarse woody debris	Belowground
Bush	0.0011 [35]	0.0021*DBH [36, 37]	0.1546 [35, 38, 39]	0.2400 [35, 38, 40, 41]	0.3177 [35, 42]
Crop	0.1987 [43-45]	N/A	0.1987*0.2039 [N/A ²]	0.1987*0.4769 [N/A ³]	0.3209 [46-48]
Forest	0.0043 [30-32]	0.0052*DBH [49]	0.0518 [50, 51]	0.0622 [40, 41, 50-52]	0.2578 [35, 51, 53-56]
Grass	0.1987*0.5 [N/A ⁴]	N/A	0.1987*0.5*0.2039 [N/A ²]	0.1987*0.5*0.4769 [N/A ³]	1.6 [57]
Mangrove	0.0227 [58]	0.0059*DBH [59] from [60]	0.5054 [58, 61, 62]	0.0835 [63]	0.2691 [63, 64]
Other	N/A	N/A	0.3250 [65]	0.4 [40]	0 [N/A ⁵]
Savanna	0.3842 [45, 66, 67]	0.0021*DBH [36, 37]	0.2039 [38, 45, 67-69]	0.4769 [38, 40, 45, 66, 70]	0.7437 [57, 71]
Wetland	0.0526 [72]	N/A	N/A	0.2542 [73]	1.9456 [74, 75]
Wood	0.2048 [66, 67, 76]	0.0021*DBH [36, 37]	0.1145 [38, 67-69]	0.1274 [38, 40, 41, 66, 69, 77]	0.3856 [57, 68, 78]

¹ To incorporate the smaller trees in these studies it was assumed that the number of trees below 10cm diameter at breast height was a linear relationship. If data on the DBH threshold was unavailable it was assumed individually based on each paper in an ad hoc basis.

² The measured vegetation in cropland and grassland is assumed to produce minimal litter. Hence the unmeasured woody part is the source of the litter and the ratio of this component to litter is assumed to be the same as savanna.

³ The unmeasured vegetation of both cropland and grassland is assumed to be woody and produce all of the coarse woody debris in the classification. The ratio of this component to coarse woody debris is assumed to be the same as that from savanna.

⁴ The unmeasured vegetation type ratio for grassland is assumed to be 50% ratio for crops.

⁵ The belowground component for the category 'other' is assumed to be zero.

App. 3.4 The carbon values, confidence limits and percent error for all five IPCC carbon pools using the original land cover categories (Area (million ha); M - Median carbon storage ($Mg\ ha^{-1}$); ICI - Lower 95% confidence interval of carbon storage ($Mg\ ha^{-1}$); uCI - Upper 95% confidence interval of carbon storage ($Mg\ ha^{-1}$); % - Percent error (%); n – Sample size)

App. 3.6 The derivation of final soil carbon values and 95% CIs.

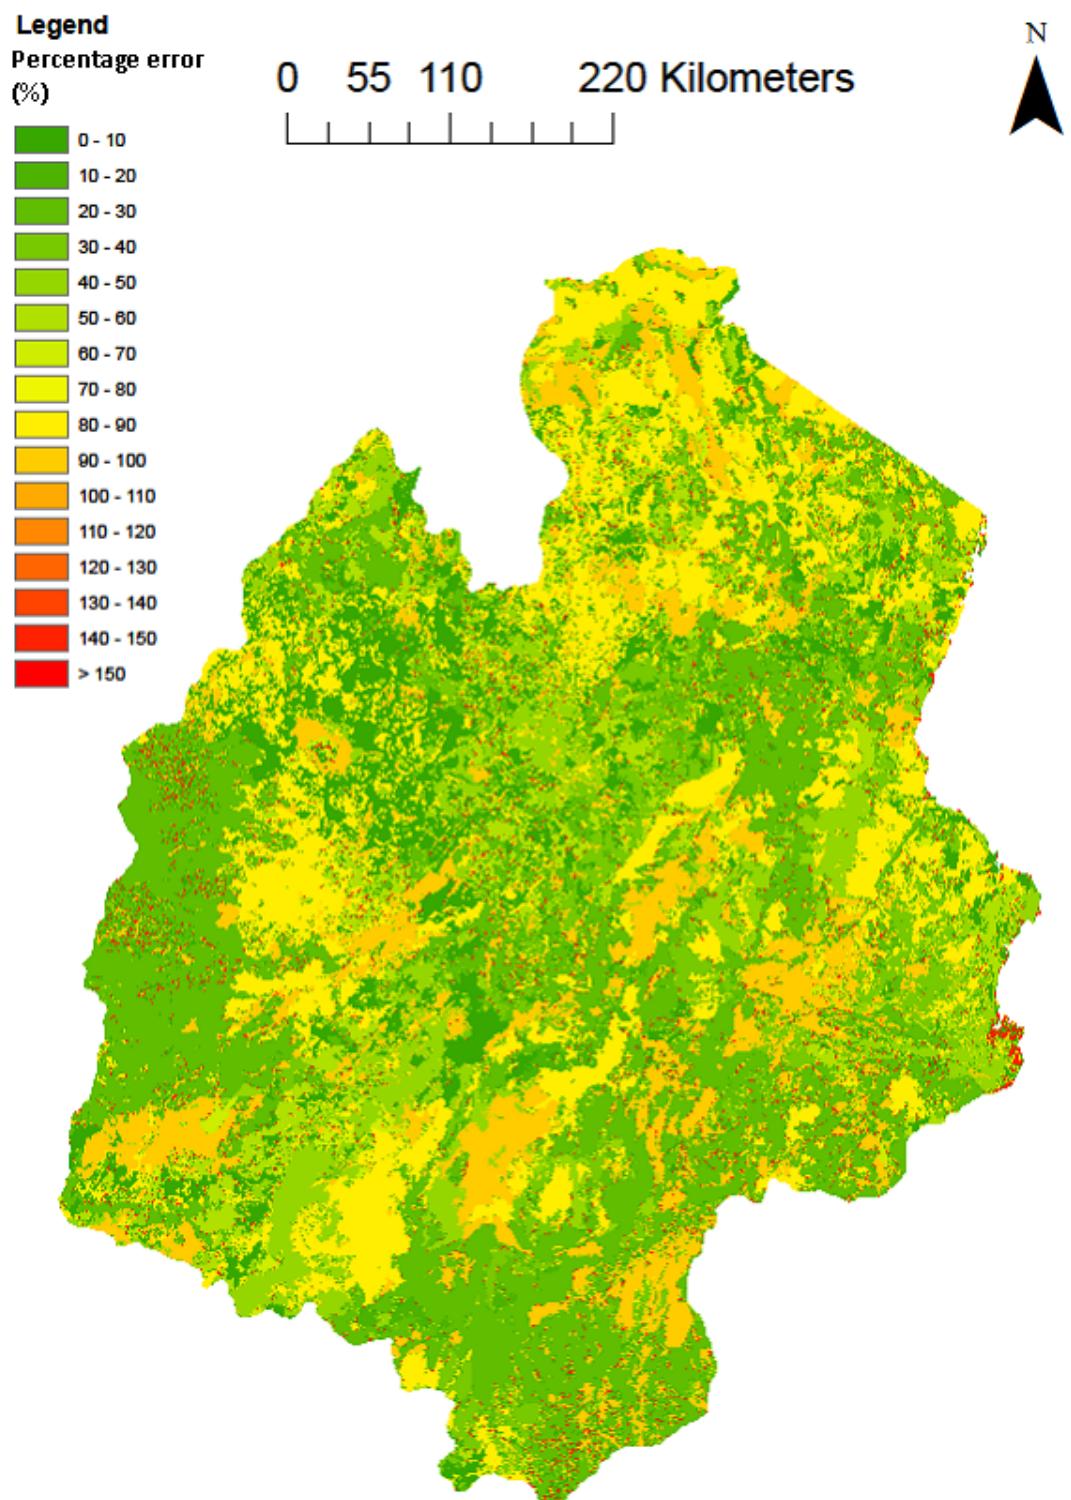

*For an explanation of the codes see App. 3.7.

App. 3.7 The median weighted total carbon values and 95% confidence limits for the study region.

Category Code	Description	Carbon value	Lower 95%CI	Upper 95% CI	References
1908 1	1 Salt Steppes*	99.3	90.8	114.9	[23, 81, 87] & unpublished data
1908 10	10 Dry forest (forest -steppe, Miombo forest) or tree-steppe with few grasses with low tree diversity (few dominating species) often growing in single-species patches)*	302.3	232.8	351.9	[23, 66, 68] & unpublished data
1908 11	11 High altitude grassland and high mountain steppe alongside alpine scrub and rock in high altitude regions*	153.4	104.7	162.8	[23, 42, 46, 83, 84]
1908 12	12 Open grass prairies, with only very few trees or shrubs*	153.4	104.7	162.8	[23, 42, 46, 83, 84]
1908 13	13 Steppe with few grasses, often with rocks, sometimes also with low, mostly thorny shrubs and trees, then orchard steepe with few grasses*	102	81.8	138.3	[23, 81, 87]
1908 2	2 Mangrove and Creekland*	224.5	145.1	424.2	[23, 54, 63, 64, 74, 75, 81, 85, 86, 89]
1908 3	3 Alluvial land with West African Species*	379.9	355.2	406.5	[23] & unpublished data
1908 4	4 Alluvial land in rain-poor areas, often park-like*	380.1	355.3	406.6	[23] & unpublished data
1908 5	5 Tropical rainforests of the flat plains and the mountains*	444.1	408.1	485.3	[23, 49, 50, 81, 96, 97] & unpublished data
1908 6	6 Cloud or high altitude forest*	418.6	388.4	453.4	[23] & unpublished data
1908 7	7 Park-like grove of the coastlines with high tree and shrub diversity*	378.4	353.7	405.1	[23, 35] & unpublished data
1908 8	8 Dry woody scrub bush and mountainous bush, sometimes with evergreen species, in some places with trees and often merging into bust-tree and grass steppe*	212.4	149.8	302.7	[23, 35, 42] & unpublished data
1908 9	9 Individual mountains with bush-kind vegetation*	212.2	149.5	302.2	[23, 35, 42] & unpublished data
1923 adgs	Acacia desert grass savanna	108.1	98.8	123.2	[23, 81, 87] & unpublished data
1923 atgs	Acacia tall grass savanna	211.6	135.6	281.4	[23, 66, 68, 71, 78, 81, 87, 88, 105] & unpublished data
1923 am	Alpine meadow	153.4	104.7	162.8	[23, 42, 46, 83, 84]
1923 df	Dry forest	301.8	232.3	352	[23, 66, 68] & unpublished data
1923 hgts	High grass low tree savanna	159.5	140.8	199.6	[23, 66, 68, 71, 78, 81, 87, 88, 104-106] & unpublished data
1923 m	Mangrove	231.1	151.6	455.9	[23, 63, 64, 85, 86]
1923 mg	Mountain grass	153.4	104.7	162.8	[23, 42, 46, 83, 84]

* translations from German [107]

App. 3.8 The spatial distribution of the size of the cell 95% CI (expressed as a percentage) for the aboveground live carbon pool, using original land use categories.

App. 3.9 The carbon values and confidence limits for the aboveground live carbon pool using the original and harmonised land cover categories without any form of weighting. These values are not significantly different from the weighted values shown in Table 2.3 and App. 3.4 when a paired t-test is performed (p-value < 0.693). The range of landscape values derived from these (1.22 [0.91-1.61] Pg C and 1.70 [1.46-1.98] Pg C for original and harmonised land cover categories respectively) overlap those derived from the weighted values and are also significantly higher than previous estimates (Table 2.2). (Area (million ha); M - Median carbon storage ($Mg\ ha^{-1}$); ICI - Lower 95% confidence interval of carbon storage ($Mg\ ha^{-1}$); uCI - Upper 95% confidence interval of carbon storage ($Mg\ ha^{-1}$); n – Sample size)

Appendix 4

App. 4.1 The PCA axis of environmental variables spanned by my 1,611 plots. Axis 1 is dominated by temperature variables. The correlation coefficient between MAT and other variables is also shown. Elevation and anthropogenic disturbance (not shown) had correlation coefficients ranges of 0.92 to 0.96 and -0.30 to 0.35 respectively.

Variable	Description	Resoltion	Source	Axis 1	Axis 2	Axis 3	Axis 4	Axis 5	Correlation with MAT
Mean burned area probability in the fourth quarter	The mean burnt area probability from January to March	0.5km	[25]	0.028817	0.436769	-0.22405	0.217956	-0.11453	-0.05
Mean burned area probability in the third quarter	The mean burnt area probability from April to June			0.042253	0.427735	-0.20595	0.200203	-0.1424	-0.07
Annual mean burned area probability	The annual mean burned area probability			0.038842	0.484005	-0.24165	0.235007	-0.1418	-0.07
Total nitrogen content of the soil	The amount of organic carbon present in the soil to a depth of 1m	10km	[23, 24]	0.187956	0.276185	0.22216	-0.37162	-0.13668	-0.35
Total carbon content of the soil	The amount of nitrogen present in the soil to a depth of 1m			-0.21043	0.261661	0.396431	-0.09508	0.107052	0.14
Total available water capacity of the soil	The available water capacity of the soil to a depth of 1m			-0.13038	-0.00075	0.265522	0.357736	-0.14687	0.02
pH of the soil	The mean pH of the soil to a depth of 1m			-0.28239	-0.00214	0.303893	0.377933	0.100051	0.22
Percentage sand content of the soil	The mean percentage mass of sand in the soil to a depth of 1m			0.087656	-0.19291	-0.35074	0.168144	-0.21462	0.01
Soil fertility	A mean measure of soil fertility to a 1m depth. Calculated as ((100-Aluminium saturation)/100)*effective cation exchange capacity			0.233446	0.190747	-0.03035	-0.47566	-0.13187	-0.27
Mean annual global horizontal solar radiation	The mean annual global horizontal solar radiation at ground level	40km	[30, 31]	-0.15015	0.150255	0.01957	0.099889	0.364822	0.11
Aspect	The aspect of the slope	0.1km	[12]	-0.09031	-0.01527	0.043953	-0.22473	-0.17124	0.17
Wind speed	The mean annual wind speed 50m above the ground	0.2km	[22]	0.151085	-0.25267	-0.30176	0.087243	0.292845	-0.14
Mean maximum cumulative water deficit	Maximum mean cumulative water deficit (calculated as [15])	4km	[20, 21]	-0.2134	0.227975	-0.12155	-0.15869	0.480611	0.34
Mean number of dry months annually	The average number of months annually that precipitation is exceeded by potential evapotranspiration			-0.22289	0.126725	-0.25759	-0.19297	0.422544	0.44

Mean annual temperature	The mean annual temperature derived from the mean monthly temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset	0.1km [11, 12]		-0.4073	-0.06801	-0.21286	-0.12644	-0.19817	1
Mean annual maximum monthly temperature	The mean annual maximum temperature derived from the mean monthly maximum temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset			-0.36416	-0.0943	-0.29076	-0.12279	-0.16486	0.97
Mean annual minimum monthly temperature	The mean annual minimum temperature derived from the mean monthly minimum temperatures. Made more resolute using the elevation difference observed between the climate data digital elevation model and a higher resolution dataset			-0.42556	-0.04709	-0.14756	-0.12722	-0.21809	0.98
Mean annual monthly temperature range	The difference between the mean annual maximum and minimum temperatures			0.359161	-0.05696	-0.17193	0.083342	0.222735	0.98
Standard deviation				2.129	1.6895	1.5965	1.5546	1.11668	
Proportion of Variance				0.2518	0.1586	0.1416	0.1343	0.06928	
Cumulative Proportion				0.2518	0.4104	0.552	0.6863	0.75555	

App. 4.2 Mean biomass estimates for forested land within my study area using moist and dry forest allometric equations [108].

Allometric equation	Inputs	Biomass Estimate, Mg ha ⁻¹ (95% CI range)
Moist forest equation	DBH, height and WSG	314.2 (300.6-327.6)
Moist forest equation	DBH and WSG	495.6 (475.8-515.2)
Dry forest equation	DBH, height and WSG	280.2 (269.0-291.2)
Dry forest equation	DBH and WSG	262.4 (253.4-271.6)

App. 4.3 The correlation coefficients of the continuous candidate drivers.

App. 4.4 The mean (and 95% CI) look-up table values used to estimate the gradient of the power law relationship, the intercept of the power law relationship and WSG. Carbon storage look-up values were taken directly from App. 3.9. Due to the low sample size ($n=43$), the carbon sequestration look-up values were not separated by land cover and a value of -2.39 (-6.35 to 1.16) $\text{Mg ha}^{-1} \text{yr}^{-1}$ was used throughout the study area.

Land cover [109]	Sample Size	WSG	The gradient of the power law relationship	The intercept of the power law relationship
Lowland Forest (<1000m)	579	0.60 (0.59 to 0.61)	-0.91 (-0.98 to -0.85)	3.99 (3.72 to 4.28)
Sub-montane forest (1000-1500m)	492	0.55 (0.55 to 0.56)	-1.25 (-1.30 to -1.20)	5.68 (5.41 to 5.96)
Montane Forest (1500-2000m)	146	0.60 (0.60 to 0.61)	-1.60 (-1.71 to -1.49)	6.94 (6.46 to 7.43)
Upper-montane forest (>2000m)	27	0.61 (0.59 to 0.62)	-1.67 (-2.00 to -1.31)	7.13 (5.63 to 8.62)
Forest mosaic	1*	0.49	-1.81	8.67
Closed Woodland	38	0.64 (0.62 to 0.67)	-1.56 (-1.86 to -1.33)	6.67 (5.77 to 7.84)
Open Woodland	67	0.61 (0.59 to 0.62)	-1.45 (-1.71 to -1.20)	6.40 (5.24 to 7.51)

*Confidence intervals not calculated due to low sample size. Included in the table to highlight this lack of data.

App. 4.5 Carbon stored and sequestered across the mountain blocks of the EAM range.

Eastern Arc Mountain Block [110]	Area, km ²	Aboveground live carbon storage, Tg		Mean carbon emission, Mg ha ⁻¹ yr ⁻¹
		Tier 3	Tier 2 (Original from Chapter 2)	
North Pare	510	1.93	2.38	2.60
South Pare	2,327	8.96	9.59	2.41
West Usambara	2,945	13.52	15.96	3.64
East Usambara	1,145	5.91	7.63	2.79
